http://aass.oru.se/Research/mro/

General Focus ...

 perception systems for mobile robots (fundamentals for autonomous and safe operation)

Objective ...

 advance theoretical and practical foundations that allow mobile robots to operate in an unconstrained, dynamic environment

Approaches are Characterized by ...

- fusion of different sensor modalities
- timely integration into industrial demonstrators

D1 – Mobile Robotics

for autonomous and safe long-term operation in the real world

- technology transfer through collaborative projects with industrial partners in the area of logistics robots
- examples: autonomous forklifts and autonomous wheel loaders

Forklift Trucks (Danaher Motion, Linde MH, Stora Enso)

Forklift Trucks (Danaher Motion, Linde MH, Stora Enso)
 environment with a dynamic "background"

Forklift Trucks (Danaher Motion, Linde MH, Stora Enso)

o environment with a dynamic "background"

o requires 3D sensing

Forklift Trucks (Danaher Motion, Linde MH, Stora Enso)

Field Robotics and 3D Perception Projects at AASS

© A. J. Lilienthal et al. (Jul 26, 2012) #38

• NSAL (2005–2012) AASS (CRS Lab), Atlas Copco

- » behavior-based autonomous LHD vehicle navigation in mines
- » main contribution
 - mixed autonomous/teleoperated control

(now a commercial product)

- History of "Field Robotics" Projects
 - o NSAL (2005–2012)
 - MALTA (2008–2011) AASS, HiH, Kollmorgen, Linde Material Handling, Stora Enso Logistics
 - » Multiple autonomous forklifts for loading and transportation applications
 - » main contribution
 - navigation without reflectors
 - autonomous paper reel handling

- o NSAL (2005–2012)
- O MALTA (2008–2011) → SAVIE (2011–2014) AASS, Kollmorgen, Linde MH
 - » Multiple autonomous forklifts for loading and transportation applications
 - » Safe autonomous industrial vehicles for industrial environments
 - » topics
 - localization w minimum infrastructure (single fish-eye camera, 2D LRF)
 - obstacle detection/avoidance at "high speed"

- o NSAL (2005–2012)
- O MALTA (2008–2011) → SAVIE (2011–2014) AASS, Kollmorgen, Linde MH
 - » Multiple autonomous forklifts for loading and transportation appl
 - » Safe autonomous industrial vehicles for industrial environments
 - » topics
 - localization w minimum infrastructure (single fish-eye camera, 2D LRF)
 - detection and distance prediction of humans with reflective vest

- o NSAL (2005–2012)
- O MALTA (2008–2011) → SAVIE (2011–2014) AASS, Kollmorgen, Linde MH
 - » Multiple autonomous forklifts for loading and transportation applications
 - » Safe autonomous industrial vehicles for industrial environments
 - » topics

- localization w minimum infrastructure (single fish-eye camera, 2D LRF)
- obstacle detection/avoidance at "high speed"
- trajectory prediction / path planning, with traffic rules (\rightarrow flexibility + predictability)

- History of "Field Robotics" Projects
 - o NSAL (2005–2012)
 - o MALTA (2008–2011) → SAVIE (2011–2014)
 - SAUNA (2011–2014) AASS, Atlas-Copco, Kollmorgen, Fotonic
 - » logistics + safe autonomous vehicle navigation in dynamic environments

- o NSAL (2005–2012)
- o MALTA (2008–2011) → SAVIE (2011–2014)
- SAUNA (2011–2014) AASS, Atlas-Copco, Kollmorgen, Fotonic
 - » logistics + safe autonomous vehicle navigation in dynamic environments
 - Objective 2 Rich 3D Perception
 - compact 3D representation, registration on compact 3D representations (localization), mapping in dynamic environments, identification of drivable areas, 3D HMT SLAM

- o NSAL (2005–2012)
- o MALTA (2008–2011) → SAVIE (2011–2014)
- SAUNA (2011–2014) AASS, Atlas-Copco, Kollmorgen, Fotonic
 - » logistics + safe autonomous vehicle navigation in dynamic environments
 - Objective 2 Rich 3D Perception
 - Objective 1 Safe Motion
 - collision avoidance, trajectory modification, tracking of vehicles/humans, real-time response

- o NSAL (2005–2012)
- o MALTA (2008–2011) → SAVIE (2011–2014)
- SAUNA (2011–2014) AASS, Atlas-Copco, Kollmorgen, Fotonic
 - » logistics + safe autonomous vehicle navigation in dynamic environments
 - Objective 2 Rich 3D Perception
 - Objective 1 Safe Motion
 - Objective 3 Hybrid Planning
 - automate mission planning process (mission + motion planning), take into account multiple types of requirements/constraints, incomplete prior knowledge

o NSAL (2005–2012)

2.

o MALTA (2008–2011) → SAVIE (2011–2014)

• SAUNA (2011–2014) AASS, Atlas-Copco, Kollmorgen, Fotonic

- » logistics + safe autonomous vehicle navigation in dynamic environments
 - requirements elicited from industrial partners
 - \rightarrow solutions integrated into a "SAUNA System"

- o NSAL (2005–2012)
- o MALTA (2008–2011) → SAVIE (2011–2014)
- SAUNA (2011–2014) AASS, Atlas-Copco, Kollmorgen, Fotonic
 - » logistics + safe autonomous vehicle navigation in dynamic environments
 - » challenges
 - fleets of mixed autonomous and human-operated vehicles
 - high speeds (up to 30-40 km/h)
 - rich 3-D perception for enhanced safety and performance
 - automated mission planning capabilities at several levels of abstraction
 - collision and deadlock avoidance throughout mission planning, trajectory computation and execution
 - flexible operation, accommodation of run-time changes

- o NSAL (2005–2012)
- o MALTA (2008–2011) → SAVIE (2011–2014)
- SAUNA (2011–2014) AASS, Atlas-Copco, Kollmorgen, Fotonic
 - » logistics + safe autonomous vehicle navigation in dynamic environments
 - » challenges \leftarrow requirements elicititation from industrial partners
 - fleets of mixed autonomous and human-operated vehicles

- o RobLog (2011–2015)
- SPENCER (2013–2016) AASS, TUM, Twente, CNRS, RWTH, BlueBotics, KLM, Freiburg
 - » challenges
 - localization and mapping in dynamic and social environments
 - identify dynamics of objects
 - → robust and precise localization in highly dynamic environments
 - learning of socially annotated maps
 - related to spatial event distribution models

2.

Rich 3D for Industrial Applications

- o ... depend heavily on the application scenario, e.g. SAUNA, RobLog
- ightarrow we consider also an inspection robot that senses
 - » range
 - » colour
 - » temperature
 - » gas
 - » air flow
 - » humidity

- detailed model (detailed "enough")
 - » SAUNA: allows extraction of drivable area at reasonably high speeds

DOISS

- detailed model (detailed "enough")
 - » SAUNA: allows extraction of drivable area at reasonably high speeds
 - » RobLog: allows identification of objects from partial views (occlusion)
 - \rightarrow allows inference (predicting future states)

- o detailed model (detailed "enough")
 - » SAUNA: allows extraction of drivable area at reasonably high speeds
 - » RobLog: allows identification of objects from partial views (occlusion)
 - \rightarrow allows inference (predicting future states)
 - » Inspection Robot: allows for detection of changes that are of potential interest to human decision makers

o detailed model

ass

o dense (quasi-continuous) model from sparse measurements

- » SAUNA: model uncertainty between distant measurements
- » RobLog: dense enough for object recognition
- » Inspection Robot: change detection for arbitrary points in space from nonaligned measurements

- o detailed model
- o dense (quasi-continuous) model from sparse measurements

compact model

- » often large amount of data
- » compact memory requirements do not scale with time but with the size of the environment
- » queries often faster in a compact model
- » \rightarrow compact yet truthful and versatile representation required

o detailed model

3.

o dense (quasi-continuous) model from sparse measurements

o compact model

- » SAUNA: allows for real-time and long-term operation
- » SAUNA: all operations need to be carried out on the compact model

- o detailed model
- o dense (quasi-continuous) model from sparse measurements

compact model

- » SAUNA: allows for real-time and long-term operation
- » SAUNA: all operations need to be carried out on the compact model
- » Inspection Robot: detect changes compared to old model

- o detailed model
- o dense (quasi-continuous) model from sparse measurements
- o compact model
- probabilistic model
 - » model should represent uncertainty about the state of the world
 - » can be in a separate layer

o detailed model

3.

- o dense (quasi-continuous) model from sparse measurements
- o compact model
- o probabilistic model
- layered model
 - » layers carry most of the meaning
 - object labels + corresponding uncertainty
 - semantic categories + corresponding uncertainty
 - distribution of social behaviours, temperature, colour, gas, ...

- o detailed model
- o dense (quasi-continuous) model from sparse measurements
- o compact model
- o probabilistic model
- layered model
 - » layers carry most of the meaning
 - object labels + corresponding uncertainty
 - semantic categories + corresponding uncertainty
 - distribution of social behaviours, temperature, colour, gas, ...

o detailed model

3.

- o dense (quasi-continuous) model from sparse measurements
- o compact model
- o probabilistic model
- o layered model
- maintenance of model in a dynamic environment
 - » online update
 - » representation of changes over time

 - » find (local) maximum using Newton's method and analytical derivative expressions
 - » hot start
 - derive a simple initialization, based on the 3D-NDT Histogram
 - look for transformation resulting in best overlap between histograms.
 - select one or several of the best initial guesses

o tested over two data sets — indoor and outdoor, 3D aLRF

- o results
 - » translation deviation from known ground truth transformations

Error Norm Translation AASS

- o results
 - » translation deviation from known ground truth transformations

Error Norm Translation AASS

- o results
 - » translation deviation from known ground truth transformations

Error Norm Translation AASS

- o results
 - » translation deviation from known ground truth transformations

Error Norm Translation AASS

o results

- translation deviation from known ground truth transformations **>>**
 - only successful registrations (inliers) \rightarrow much better convergence of 3D-NDT

Error Norm Translation AASS (Inliers)

- o results
 - » translation deviation from known ground truth transformations
 - only successful registrations (inliers) \rightarrow much better convergence of 3D-NDT

o results

IOSS

- » translation deviation from known ground truth transformations
 - only successful registrations (inliers) \rightarrow much better convergence of 3D-NDT
 - percentage of inliers highest for NDT-to-NDT and increases when using hotstart

o results

- » translation deviation from known ground truth transformations
 - only successful registrations (inliers) ightarrow much better convergence of 3D-NDT
 - percentage of inliers highest for NDT-to-NDT and increases when using hotstart
- » average runtimes for NDT-to-NDT at around 500 milliseconds

- o results
 - » translation deviation from known ground truth transformations
 - only successful registrations (inliers) ightarrow much better convergence of 3D-NDT
 - percentage of inliers highest for NDT-to-NDT and increases when using hotstart
 - » average runtimes for NDT-to-NDT at around 500 milliseconds
 - runtime increases when using hotstart, but NDT-to-NDT with hotstart still faster than the other two implementations

Real Time Registration of RGB-D Data using Local Visual Features and 3D-NDT Registration

- o find local visual features (SURF) from (Kinect) image data
- find closest matches and corresponding depth values (match candidates)
- RANSAC on feature pairs
 - \rightarrow initial transformation estimate (hot start)
- compute 3D-NDT components only for surrounding regions of match candidates
 - » fixed support size

5.

o test data from [Sturm et al., 2011]

» J. Sturm, S. Magnenat, N. Engelhard, F. Pomerleau, F. Colas, W. Burgard, D. Cremers, and R. Siegwart.

"Towards a Benchmark for RGBD SLAM Evaluation".

In Proc. of the RGB-D Workshop on Advanced Reasoning with Depth Cameras

at Robotics: Science and Systems Conf. (RSS), Los Angeles, USA, June 2011.

- o test data from [Sturm et al., 2011]
- test of different registration variations
 - » RGB images downscaled by 1/4 (side length, for real-time performance)

- o test data from [Sturm et al., 2011]
- test of different registration variations
 - » RGB images downscaled by 1/4 (side length, for real-time performance)
 - » comparison of "NDT F" with [Steinbrucker et al., 2011]
 - F. Steinbrucker, J. Sturm, and D. Cremers. "Real-time Visual Odometry from Dense RGB-D Images". In Workshop on Live Dense Reconstruction with Moving Cameras at the Intl. Conf. on Computer Vision (ICCV), 2011.

- o test data from [Sturm et al., 2011]
- test of different registration variations
 - » RGB images downscaled by 1/4 (side length, for real-time performance)
 - » comparison of "NDT F" with [Steinbrucker et al., 2011]

Dataset	\bar{x} (m)	\tilde{x} (m)	$\bar{\theta}$ (deg)	$\tilde{\theta}$ (deg)	\bar{fps} (Hz)

iMAC Occupancy Grid Maps for Representation of Dynamic Environments

 Jari Saarinen, Henrik Andreasson, and Achim J. Lilienthal.
 "Independent Markov Chain Occupancy Grid Maps for Representation of Dynamic Environments".
 IROS 2012, to appear.

5.

o model each cell as an independent Markov chain

o model each cell as an independent Markov chain

o learn Poisson rate parameters for exit and entry process

$$\hat{\lambda}_{exit} = \frac{\alpha_{exit}}{\beta_{exit}} = \frac{\#events: occupied to free+1}{\#observations when occupied+1}$$
$$\hat{\lambda}_{entry} = \frac{\alpha_{entry}}{\beta_{entry}} = \frac{\#events: free to occupied+1}{\#observations when free+1}$$

o model each cell as an independent Markov chain

learn Poisson rate parameters for exit and entry process

o identify different dynamics based on learned Poisson parameters

$$\hat{\lambda}_{exit} = \frac{\alpha_{exit}}{\beta_{exit}} = \frac{\#events: occupied to free+1}{\#observations when occupied+1}$$
$$\hat{\lambda}_{entry} = \frac{\alpha_{entry}}{\beta_{entry}} = \frac{\#events: free to occupied+1}{\#observations when free+1}$$

Functional state	λ_{exit}	λ_{entry}
Static occupied	$\rightarrow 0$	High
Static free	High	$\rightarrow 0$
Semi-static	Low	Low
Dynamic	High	Low
Semi-static occupied (doors)	Low	High

- o model each cell as an independent Markov chain
- learn Poisson rate parameters for exit and entry process
- identify different dynamics based on learned Poisson parameters
- use recency-weighted approach

5.

o model each cell as an independent Markov chain

- learn Poisson rate parameters for exit and entry process
- o use rate parameters as estimate of state change probability

$$\hat{\lambda}_{exit} \sim p(m=0|m=1)$$
$$\hat{\lambda}_{entry} \sim p(m=1|m=0)$$

5.

- long-term data collection in industrial environment
 - » milk production plant
 - » Laser Guided Vehicle (LGV) in production use

- o long-term data collection in industrial environment
 - milk production plant **>>**
 - Laser Guided Vehicle (LGV) in production use **>>**
 - get orders from the production area and deliver them to the storage area

5.

- long-term data collection in industrial environment
 - » milk production plant
 - » Laser Guided Vehicle (LGV) in production use
 - » data from 2D Sick LRF
 - » pose data from positioning system
 - » 10h of operation (8.8km trajectory)
 - » dynamics in the environment
 - other LGVs (10)
 - manually operated forklifts
 - people
 - ever changing storage layout

long-term data collection in industrial environment

o results (black ⇔ max.)

» λ_{entry} (logarithmic scale)

aass

- o long-term data collection in industrial environment
 o results (black ⇔ max.)
 - » λ_{entry}
 - » λ_{exit}
 - busy corridors are more visible with time

o long-term data collection in industrial environment
o results (black ⇔ max.)

```
» \lambda_{entry}, \lambda_{exit} pairs
```

long-term data collection in industrial environment

- o results (black ⇔ max.)
 - » analyse timescales <> analyse behaviour of Markov chains after N steps

- long-term data collection in industrial environment
- o analyse timescales ⇔ behaviour of Markov chains after N steps
 - activity shown for smaller N ⇔ shorter timescales
 - N=8
 motion and sensor noise
 - N=32 ⇔ starts to reveal semi-static parts

3D-NDT in Dynamic Environments (A First Glimpse)

© A. J. Lilienthal et al. (Jul 26, 2012) #181

3D-NDT Model Maintenance (Saarinen et al.)

o online updates

3D-NDT Model Maintenance (Saarinen et al.)

o online updates

\circ create model at different timescales (diff \rightarrow dyn. objects)

3D Perception for Transport and Inspection Robots
