Multiple View Geometry: Exercise Sheet 6

Prof. Dr. Daniel Cremers, Julia Diebold, Jakob Engel, TU Munich

`http://vision.in.tum.de/teaching/ss2014/mvg2014`

Exercise: May 26th, 2014

Part I: Theory

The following exercises should be **solved at home**. You do not have to hand in your solutions, however, writing it down will help you present your answer during the tutorials.

1. The essential matrix $E = \hat{T}R$ has the singular value decomposition $E = U\Sigma V^T$. Let $R_Z\left(\pm\frac{\pi}{2}\right)$ be the rotation by $\pm\frac{\pi}{2}$ around the z-axis.

   Show the following properties:

   (a) $\hat{T} \in so(3)$ (i.e. $\hat{T}$ is a skew-symmetric matrix)

   (b) $R \in \mathrm{SO}(3)$ (i.e. R is a rotation matrix)

   Hint: Use the equalities: $\hat{T} = UR_Z\left(\pm\frac{\pi}{2}\right)\Sigma\, U^\top$ and $R = UR_Z\left(\pm\frac{\pi}{2}\right)^\top V^\top$.

2. Consider the matrices $E = \hat{T}R$ and $H = R + Tu^\top$ with $R \in \mathbb{R}^{3\times 3}$ and $T, u \in \mathbb{R}^3$.
   Show that the following holds:

   (a) $E = \hat{T}H$

   (b) $H^\top E + E^\top H = 0$

3. Let $F \in \mathbb{R}^{3\times 3}$ be the fundamental matrix for the cameras C_1 and C_2. Show that the following holds for the epipoles e_1 and e_2:

$$Fe_1 = 0 \qquad \text{and} \qquad e_2^\top F = 0$$

Part II: Practical Exercises

This exercise is to be solved **during the tutorial**.

1. Download the package `mvg_exerciseSheet_05.zip` from the website and extract the images `batinria0.tif` and `batinria1.tif`.

2. **Get the 2D coordinates of corresponding point pairs:** Show the first image and mark at least 8 points. You can retrieve the pixel coordinates of mouse clicks with the command `[x,y] = ginput(gcf)`. Then show the second image and click at the corresponding points in the same order. Again you can get the pixel coordinates with `ginput`. Now you should have the 2D coordinates of corresponding point pairs.

3. **Implement the 8-point algorithm** from the lecture and run it with these point pairs. To this end, you have to transform the coordinates. The intrinsic camera matrices are:

$$K1 = \begin{pmatrix} 844.310547 & 0 & 243.413315 \\ 0 & 1202.508301 & 281.529236 \\ 0 & 0 & 1 \end{pmatrix}$$

$$K2 = \begin{pmatrix} 852.721008 & 0 & 252.021805 \\ 0 & 1215.657349 & 288.587189 \\ 0 & 0 & 1 \end{pmatrix}$$

4. Reconstruct the depths of the points as described on slides 17 and 18.

Hints:

- The file `additional_information.txt` provides $K1$ and $K2$
- Use `kron` and `reshape`
- It might occur that one of the matrices U oder V of the SVD of E has a determinant less than zero. In this case, determine the SVD of $-E$.
