

# Practical Course: Vision-based Navigation Summer Term 2015

# Lecture 4: State Estimation and Control

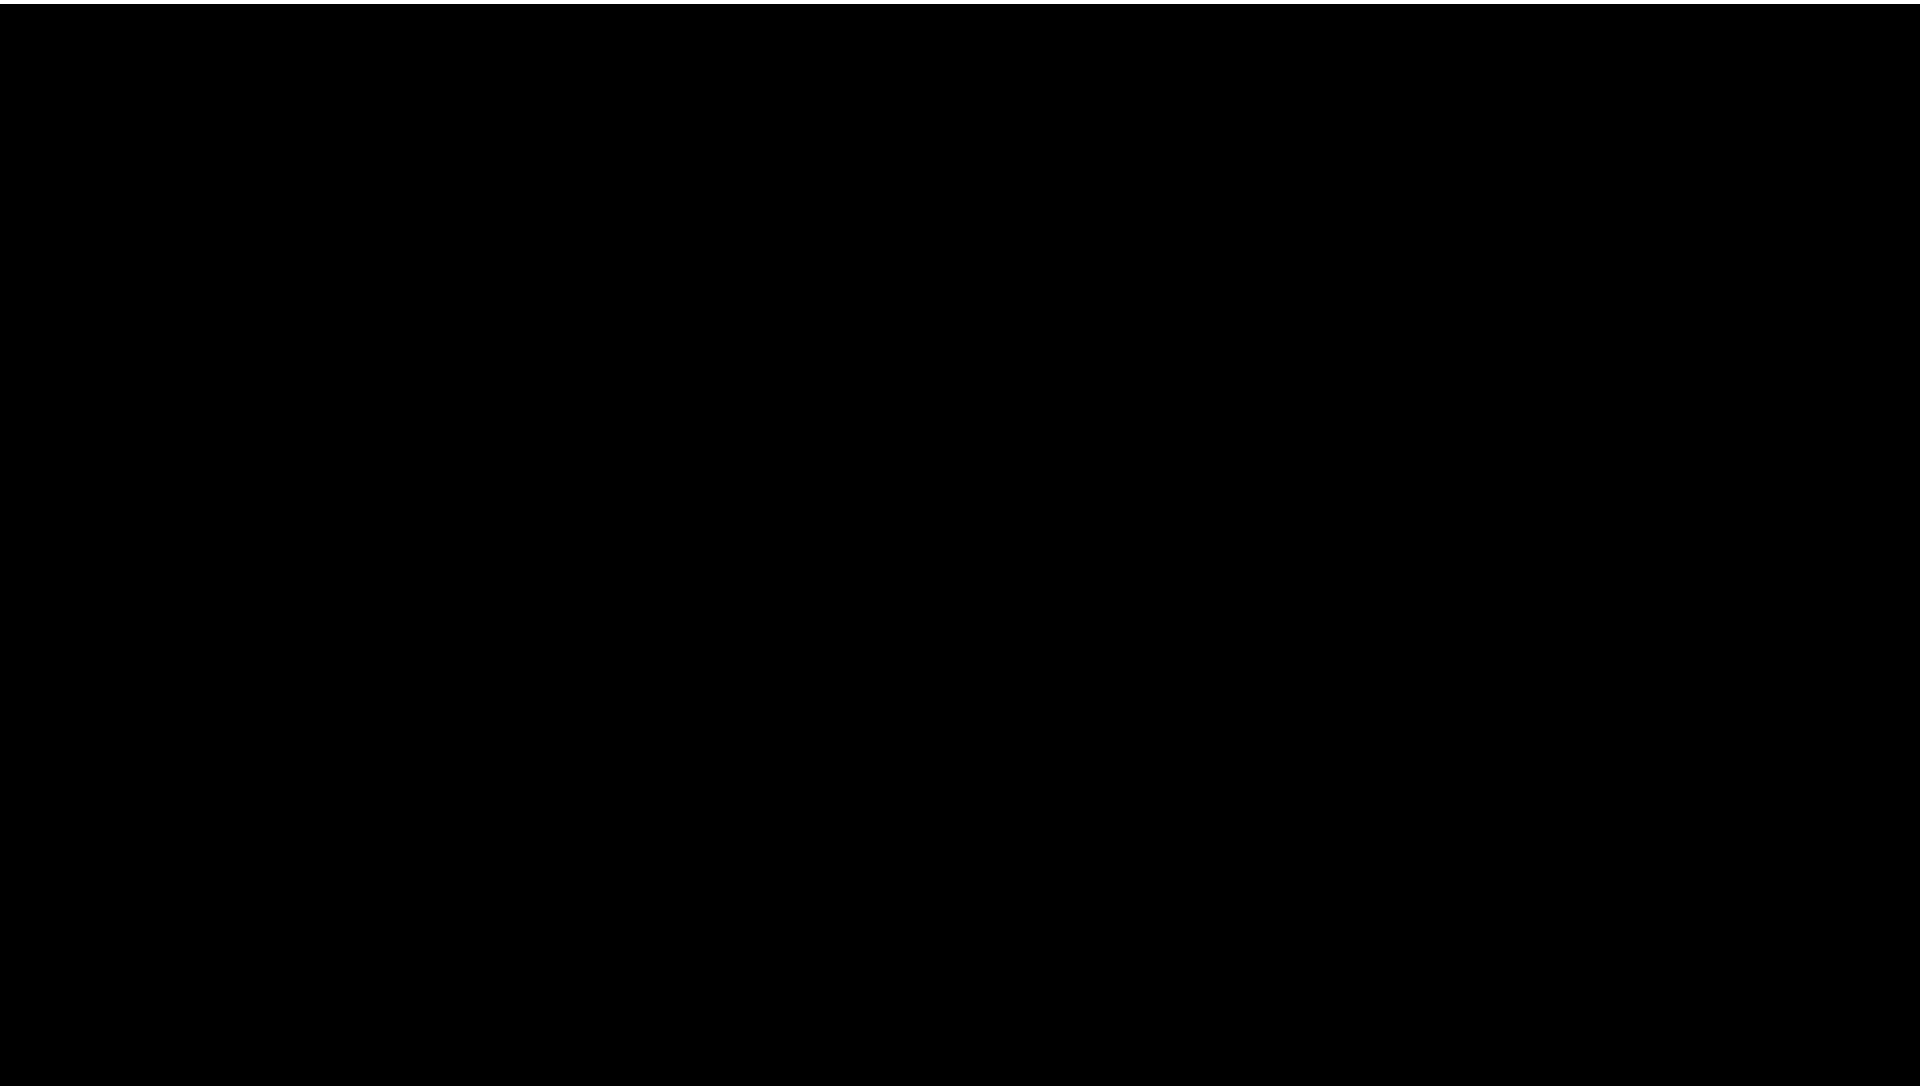
Dr. Jörg Stückler

# What we will cover today

- Introduction to vision-based state estimation and control

- State estimation
  - Bayes Filter
  - Extended Kalman Filter
  - Unscented Kalman Filter

- Control
  - PID Control
  - Cascaded Control



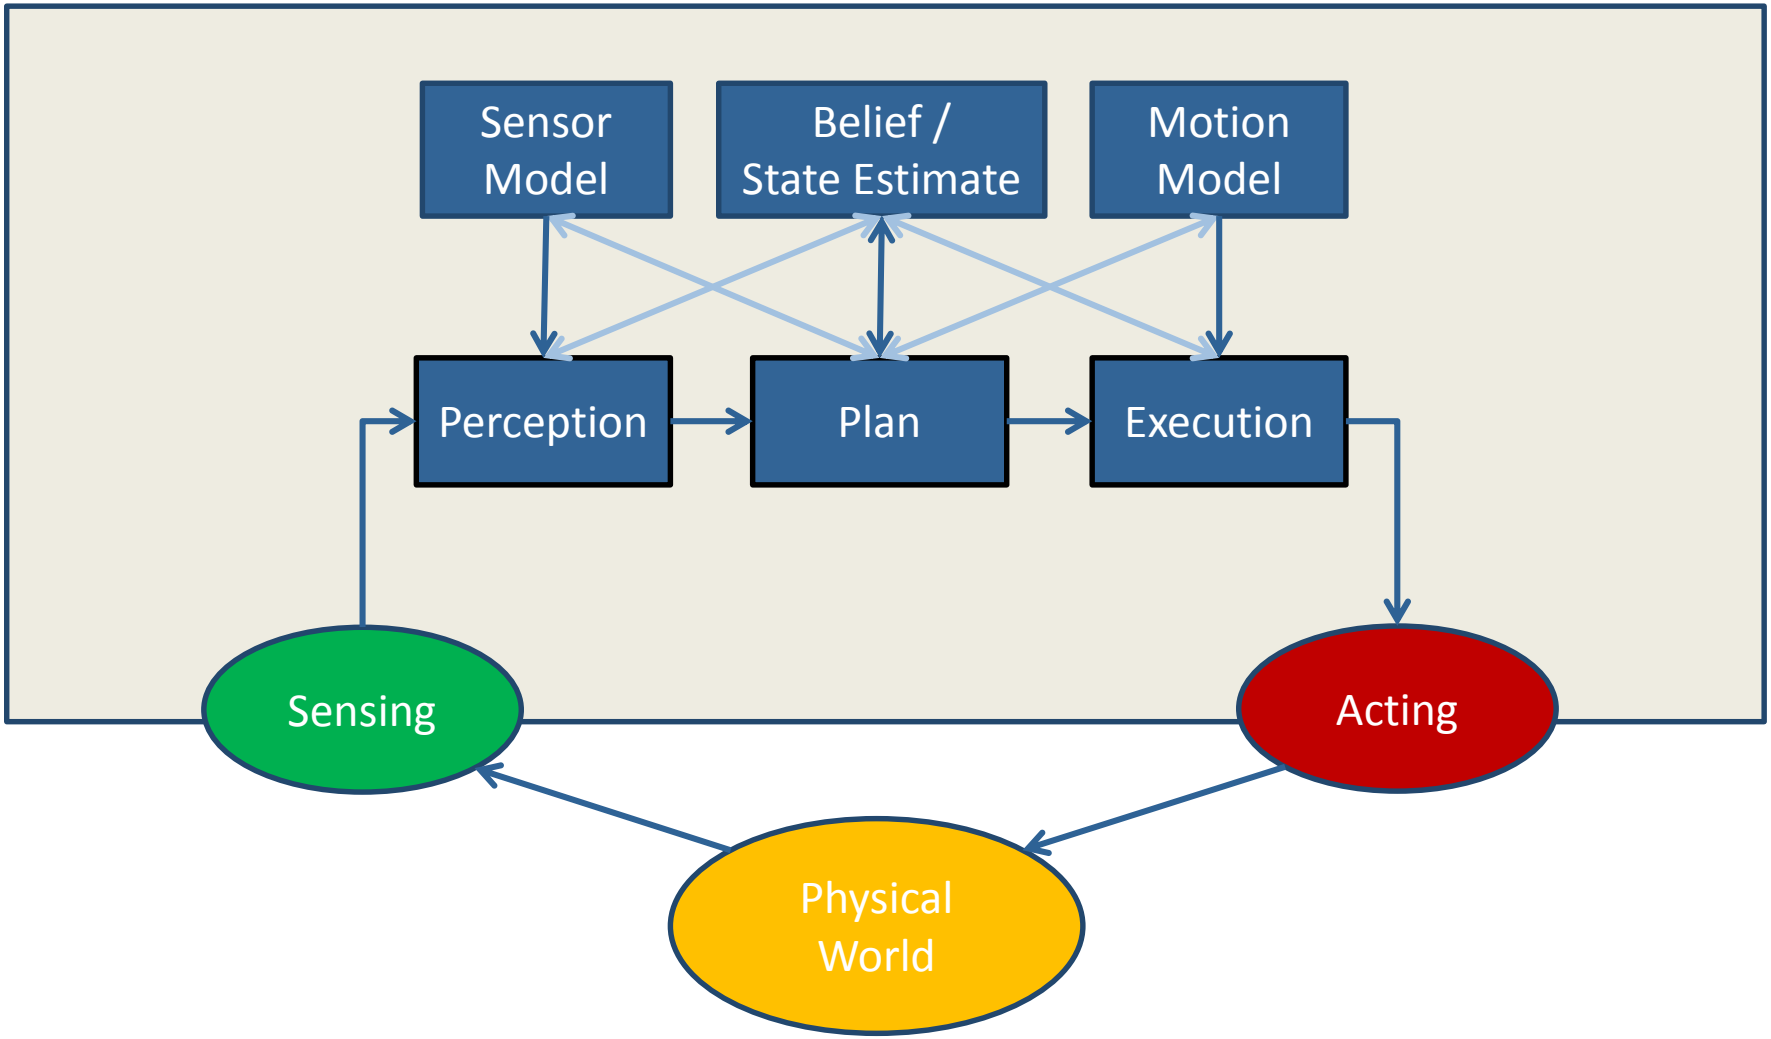
# What we will cover today

- Introduction to vision-based state estimation and control

- **State estimation**
  - **Bayes Filter**
  - **Extended Kalman Filter**
  - **Unscented Kalman Filter**

- Feedback Control
  - PID Control
  - Cascaded Control

# Models, State Estimation and Control



# The State Estimation Problem

We want to estimate the world state $x_t$ from

1. Sensor measurements $z_{1:t}$ and
2. Controls (or odometry readings) $u_{1:t}$

Probabilistic filtering: $p(x_t \mid u_{1:t}, z_{1:t})$

- How do we perform inference for the state?
- How do we model the relationship between these random variables?

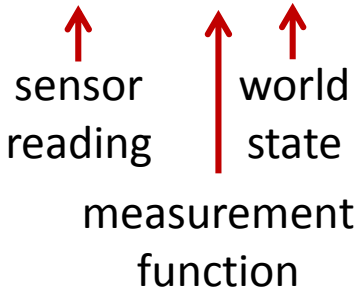
# Probabilistic Measurement Model

- Measurements depend on the actual state, but robot sensors only provide noisy versions
- Quantify probability distribution on measurements (given state)

$$p(z_t \mid x_t)$$

- Typical model: non-linear function of state and additive noise

$$z_t = h(x_t) + \delta_t \qquad \text{e.g. } \delta_t \sim \mathcal{N}(0, R)$$



# Probabilistic State-Transition Model

- Robot executes a control not accurately, i.e. the control outcome can only be predicted up to some uncertainty
- Quantify probability on control outcome (given prev. state)

$$p(x_t \mid x_{t-1}, u_t)$$

- Typical model: non-linear function of control and prev. state with additive noise

state-transition function

executed control

$$x_t = g(x_{t-1}, u_t) + \epsilon_t \qquad \text{e.g.} \quad \epsilon_t \sim \mathcal{N}(0, Q)$$

current state

previous state

# Bayes Filter

- Given:
  - Stream of measurements and controls: $z_{1:t} \quad u_{1:t}$
  - Measurement model $p(z_t \mid x_t)$
  - State-transition model $p(x_t \mid x_{t-1}, u_t)$
  - Prior probability of the system state $p(x_0)$

- Wanted:
  - Estimate of the state $x_t$ of the dynamic system
  - Posterior of the state is also called **belief**

$$\mathrm{Bel}\,(x_t) = p(x_t \mid u_{1:t}, z_{1:t})$$

# Markov Assumption

- Measurements depend only on current state

$$p(z_t \mid x_{0:t}, z_{1:t-1}, u_{1:t}) = p(z_t \mid x_t)$$

- Current state depends only on prev. state and current control

$$p(x_t \mid x_{0:t}, z_{1:t}, u_{1:t}) = p(x_t \mid x_{t-1}, u_t)$$

- Underlying assumptions
  - Static world
  - Independent noise
  - Perfect model, no approximation errors

# Bayes Filter

For each time step, do

1. Apply motion model

$$\overline{\mathrm{Bel}}\,(x_t) = \int_{x_{t-1}} p(x_t \mid x_{t-1}, u_t)\,\mathrm{Bel}\,(x_{t-1})\,dx_{t-1}$$

2. Apply sensor model

$$\mathrm{Bel}\,(x_t) = \eta\, p(z_t \mid x_t)\,\overline{\mathrm{Bel}}\,(x_t)$$

# Kalman Filter

- Bayes filter with
  - continuous states
  - Gaussian state variable and model noise
  - Linear measurement and state-transition functions
  - Extension to non-linear models (Extended Kalman Filter EKF)
- Developed in the late 1950's
- Kalman filter is very efficient (only requires a few matrix operations per time step)
- Applications range from economics, weather forecasting, satellite navigation to robotics and many more
- Most relevant Bayes filter variant in practice

# Normal Distribution

- Multivariate normal distribution

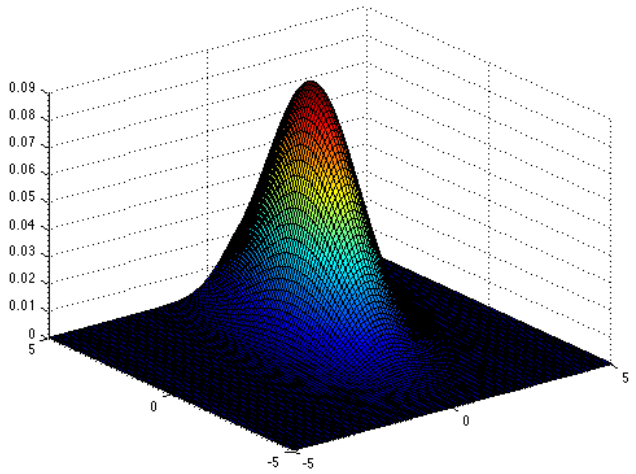
$$X \sim \mathcal{N}(\boldsymbol{\mu}, \Sigma)$$

$$p(\mathbf{x}) = \mathcal{N}(\mathbf{x}; \boldsymbol{\mu}, \Sigma)$$

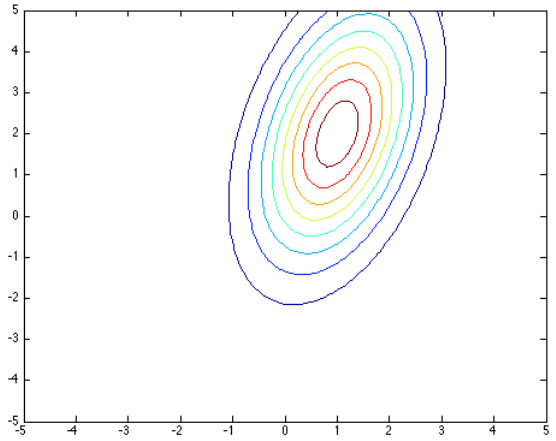
$$= \frac{1}{(2\pi)^{d/2} \, |\Sigma|^{1/2}} \exp\left(-\frac{1}{2}(\mathbf{x}-\boldsymbol{\mu})^{\top}\Sigma^{-1}(\mathbf{x}-\boldsymbol{\mu})\right)$$

- Example: 2-dimensional normal distribution

pdf



iso lines



# Properties of Normal Distributions

- Linear transformation → remains Gaussian

$$X \sim \mathcal{N}(\mu, \Sigma), Y \sim AX + B$$
$$\Rightarrow Y \sim \mathcal{N}(A\mu + B, A\Sigma A^\top)$$

- Intersection of two Gaussians → remains Gaussian

$$X_1 \sim \mathcal{N}(\mu_1, \Sigma_1), X_2 \sim \mathcal{N}(\mu_2, \Sigma_2)$$
$$\Rightarrow p(X_1, X_2) = \mathcal{N}\left(\frac{\Sigma_2}{\Sigma_1 + \Sigma_2}\mu_1 + \frac{\Sigma_1}{\Sigma_1 + \Sigma_2}\mu_2, \frac{1}{\Sigma_1^{-1} + \Sigma_2^{-1}}\right)$$

# Kalman Filter

Estimates the state $x_t$ of a discrete-time controlled process that is governed by the linear stochastic difference equation

$$x_t = Ax_{t-1} + Bu_t + \epsilon_t$$

and (linear) measurements of the state

$$z_t = Cx_t + \delta_t$$

with $\delta_t \sim \mathcal{N}(0, R)$ and $\epsilon_t \sim \mathcal{N}(0, Q)$

Initial belief is Gaussian $\mathrm{Bel}(x_0) = \mathcal{N}(x_0; \mu_0, \Sigma_0)$

# From Bayes Filter to Kalman Filter

For each time step, do

1. Apply state-transition model

$$\overline{\mathrm{Bel}}(x_t) = \int \underbrace{p(x_t \mid x_{t-1}, u_t)}_{\mathcal{N}(x_t; Ax_{t-1}+Bu_t, Q)} \underbrace{\mathrm{Bel}(x_{t-1})}_{\mathcal{N}(x_{t-1}; \mu_{t-1}, \Sigma_{t-1})} \mathrm{d}x_{t-1}$$

$$= \mathcal{N}(x_t; A\mu_{t-1} + Bu_t, A\Sigma A^\top + Q)$$

$$= \mathcal{N}(x_t; \bar{\mu}_t, \bar{\Sigma}_t)$$

# From Bayes Filter to Kalman Filter

For each time step, do

2. Apply measurement model

$$\mathrm{Bel}(x_t) = \eta \underbrace{p(z_t \mid x_t)}_{\mathcal{N}(z_t; Cx_t, R)} \underbrace{\overline{\mathrm{Bel}}(x_t)}_{\mathcal{N}(x_t; \bar{\mu}_t, \bar{\Sigma}_t)}$$

$$= \mathcal{N}(x_t; \bar{\mu}_t + K_t(z_t - C\bar{\mu}), (I - K_t C)\bar{\Sigma})$$

$$= \mathcal{N}(x_t; \mu_t, \Sigma_t)$$

with $K_t = \bar{\Sigma}_t C^\top (C\bar{\Sigma}_t C^\top + R)^{-1}$

# Kalman Filter

For each time step, do

1. Apply state-transition model

$$\bar{\mu}_t = A\mu_{t-1} + Bu_t$$
$$\bar{\Sigma}_t = A\Sigma A^\top + Q$$

2. Apply measurement model

$$\mu_t = \bar{\mu}_t + K_t(z_t - C\bar{\mu}_t)$$
$$\Sigma_t = (I - K_t C)\bar{\Sigma}_t$$

with

$$K_t = \bar{\Sigma}_t C^\top (C\bar{\Sigma}_t C^\top + R)^{-1}$$

For the interested readers:
See Probabilistic Robotics for full derivation (Chapter 3)

# Kalman Filter

- Highly efficient: Polynomial in the measurement dimensionality *k* and state dimensionality *n*:

$$O(k^{2.376} + n^2)$$

- **Optimal for linear Gaussian systems**!

- Most robotics systems are **nonlinear**!
  (i.e. nonlinear measurement and state-transition model)

# Taylor Expansion

- Solution: Linearize both functions
- State-transition function

$$g(x_{t-1}, u_t) \approx g(\mu_{t-1}, u_t) + \frac{\partial g(\mu_{t-1}, u_t)}{\partial x_{t-1}}(x_{t-1} - \mu_{t-1})$$
$$= g(\mu_{t-1}, u_t) + G_t(x_{t-1} - \mu_{t-1})$$

- Measurement function

$$h(x_t) \approx h(\bar{\mu}_t) + \frac{\partial h(\bar{\mu}_t)}{\partial x_t}(x_t - \mu_t)$$
$$= h(\bar{\mu}_t) + H_t(x_t - \mu_t)$$

# Extended Kalman Filter

For each time step, do

1. Apply state-transition model

$$\bar{\mu}_t = g(\mu_{t-1}, u_t)$$
$$\bar{\Sigma}_t = G_t \Sigma G_t^\top + Q \qquad \text{with} \qquad G_t = \frac{\partial g(\mu_{t-1}, u_t)}{\partial x_{t-1}}$$

2. Apply measurement model

$$\mu_t = \bar{\mu}_t + K_t(z_t - h(\bar{\mu}_t))$$
$$\Sigma_t = (I - K_t H_t)\bar{\Sigma}_t$$

with $K_t = \bar{\Sigma}_t H_t^\top (H_t \bar{\Sigma}_t H_t^\top + R)^{-1}$ and $H_t = \frac{\partial h(\bar{\mu}_t)}{\partial x_t}$

For the interested readers:
See Probabilistic Robotics for full derivation (Chapter 3)

# Example

- 2D case
- State $\mathbf{x} = \begin{pmatrix} x & y & \psi \end{pmatrix}^\top$
- Odometry $\mathbf{u} = \begin{pmatrix} \dot{x} & \dot{y} & \dot{\psi} \end{pmatrix}^\top$
- Measurements $\mathbf{z} = \begin{pmatrix} z_x & z_y & z_\theta \end{pmatrix}^T$ (relative to robot pose) of visual marker at position $\mathbf{l} = \begin{pmatrix} l_x & l_y & \end{pmatrix}^T$
- Fixed time intervals $\Delta t$

# Example

- State-transition function

$$g(\mathbf{x}, \mathbf{u}) = \begin{pmatrix} x + (\cos(\psi)\dot{x} - \sin(\psi)\dot{y})\Delta t \\ y + (\sin(\psi)\dot{x} + \cos(\psi)\dot{y})\Delta t \\ \psi + \dot{\psi}\Delta t \end{pmatrix}$$

- Derivative of state-transition function

$$G = \frac{\partial g(\mathbf{x}, \mathbf{u})}{\partial \mathbf{x}} = \begin{pmatrix} 1 & 0 & (-\sin(\psi)\dot{x} - \cos(\psi)\dot{y})\Delta t \\ 0 & 1 & (\cos(\psi)\dot{x} + \sin(\dot{\psi})\dot{y})\Delta t \\ 0 & 0 & 1 \end{pmatrix}$$

# Example

- Measurement function

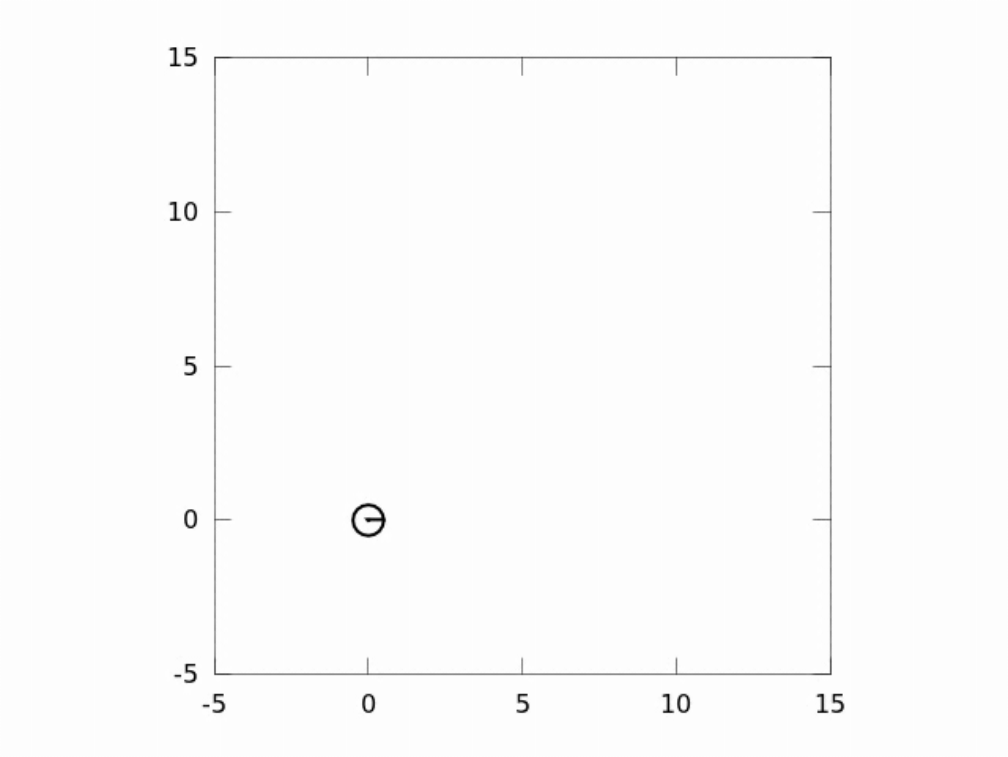
$$h(\mathbf{x}) = \begin{pmatrix} \mathbf{R}(\psi)^T & 0 \\ \mathbf{0} & 1 \end{pmatrix} \begin{pmatrix} l_x - x \\ l_y - y \\ \arctan\left(\frac{l_y - y}{l_x - x}\right) - \psi \end{pmatrix}$$

$$H = \frac{\partial h(\mathbf{x})}{\partial \mathbf{x}} = \nabla_{\mathbf{x}} \begin{pmatrix} \mathbf{R}(\psi)^T & 0 \\ \mathbf{0} & 1 \end{pmatrix} \begin{pmatrix} l_x - x \\ l_y - y \\ \arctan\left(\frac{l_y - y}{l_x - x}\right) - \psi \end{pmatrix}$$

$$+ \begin{pmatrix} \mathbf{R}(\psi)^T & 0 \\ \mathbf{0} & 1 \end{pmatrix} \nabla_{\mathbf{x}} \begin{pmatrix} l_x - x \\ l_y - y \\ \arctan\left(\frac{l_y - y}{l_x - x}\right) - \psi \end{pmatrix}$$

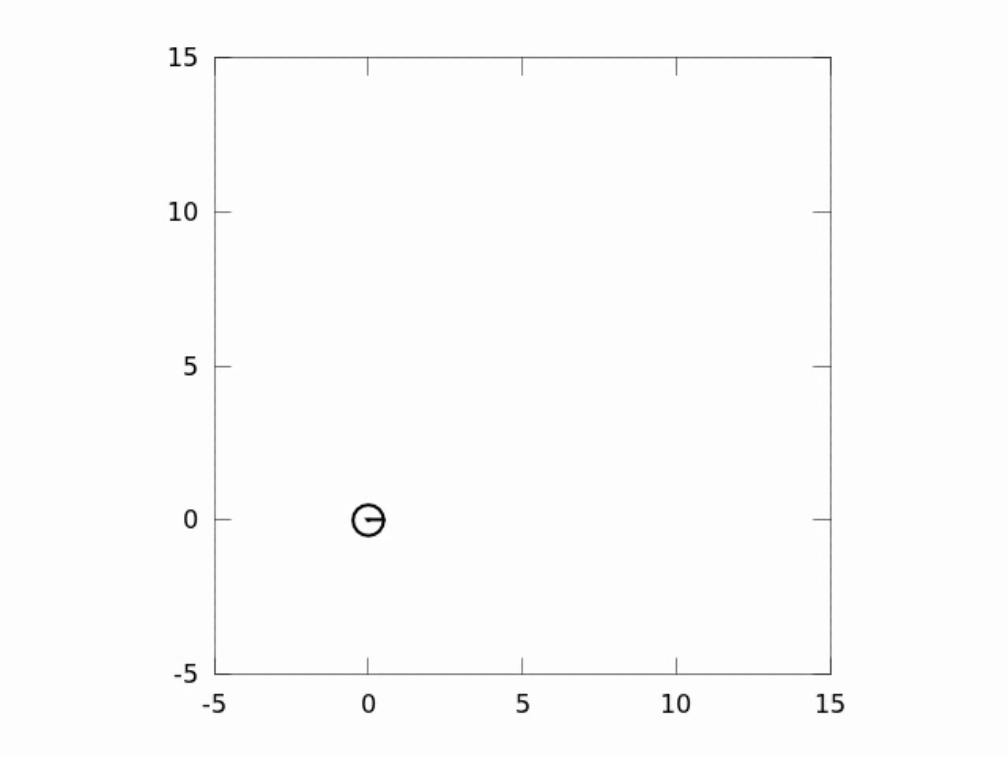
# Example

- Dead reckoning (no measurements)
- Large process noise in x+y



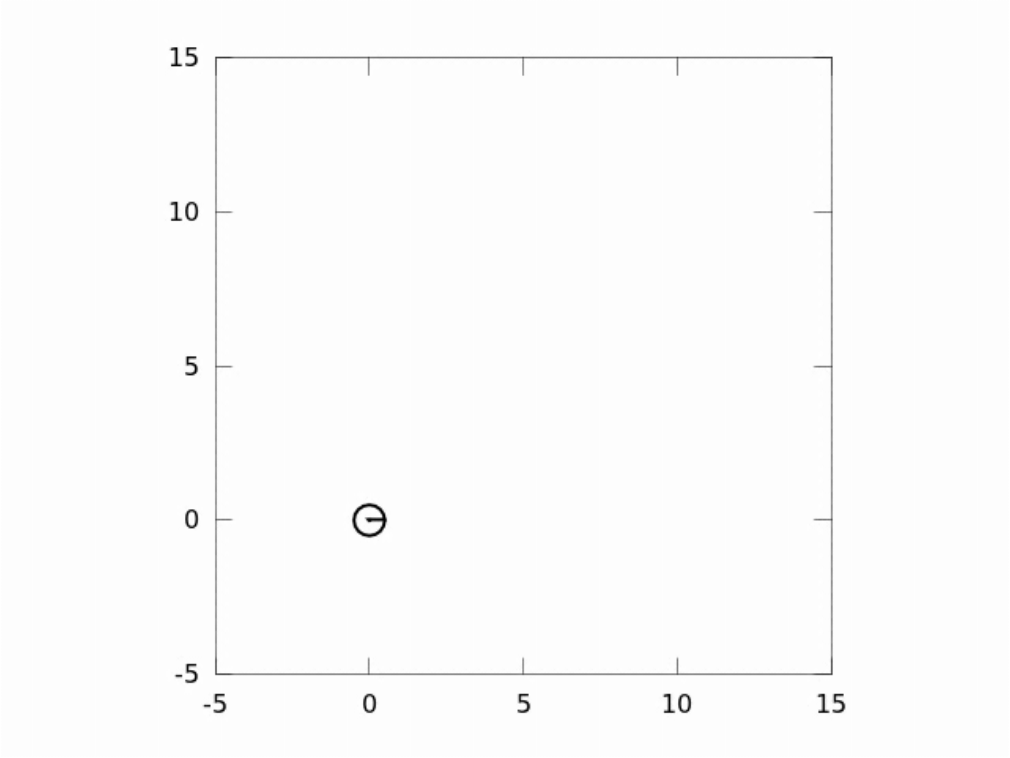
# Example

- Dead reckoning (no measurements)
- Large process noise in x+y+yaw



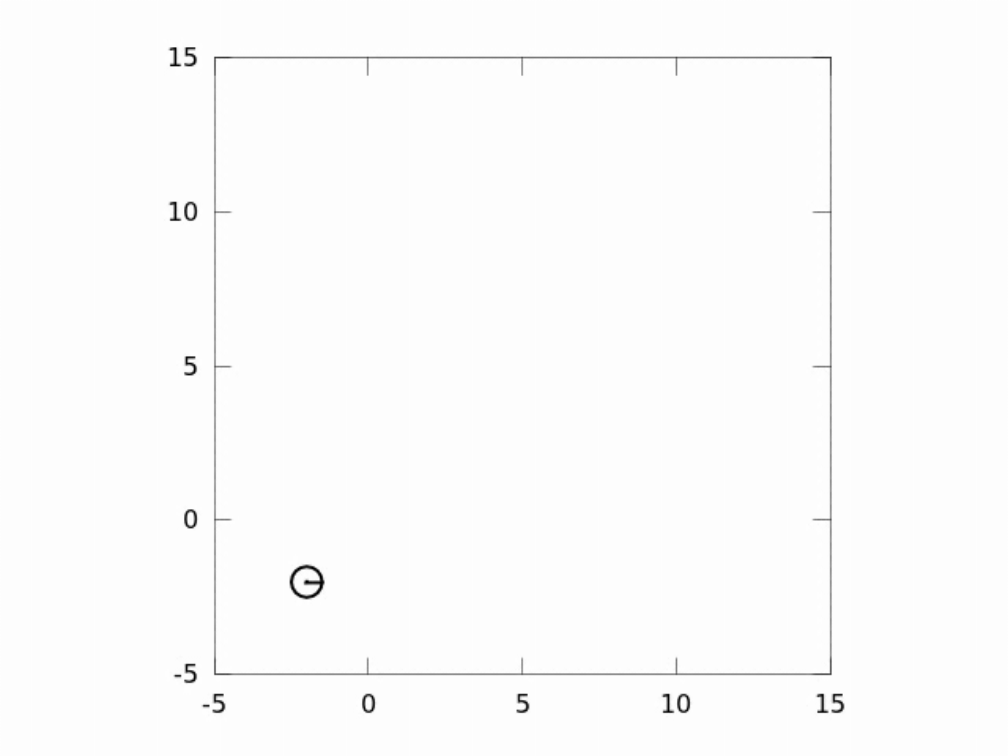
# Example

- Now with measurements (limited visibility)
- Assume robot knows correct starting pose



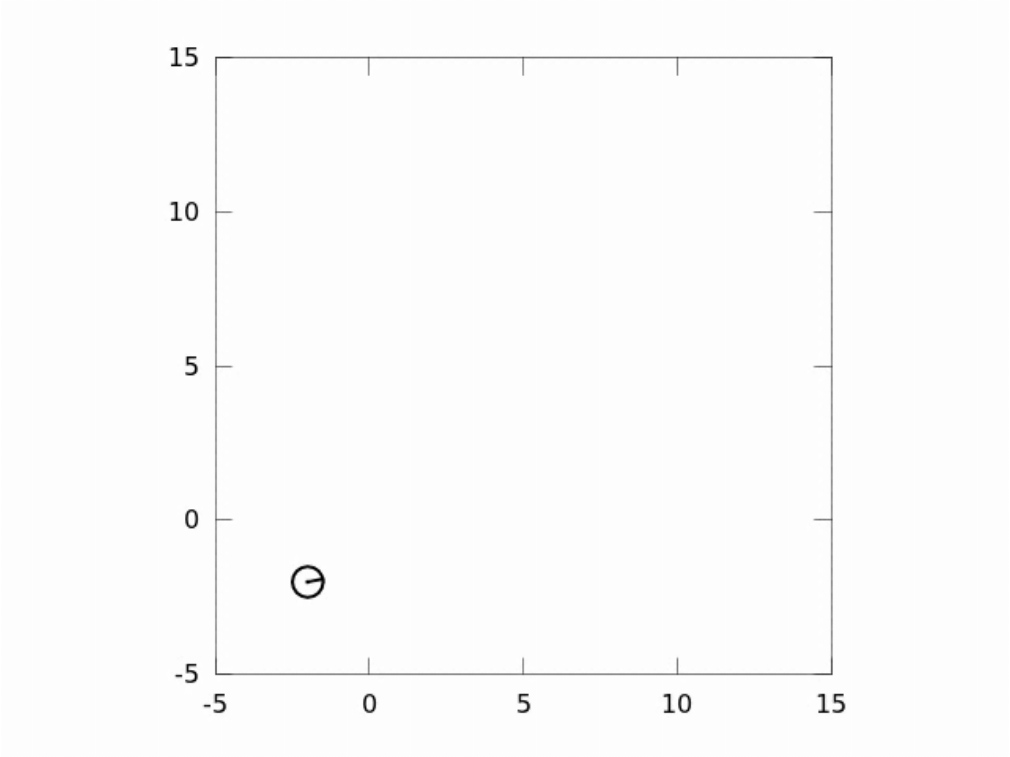
# Example

- What if the initial pose (x+y) is wrong?



# Example

- What if the initial pose (x+y+yaw) is wrong?



# Example

- If we are aware of a bad initial guess, we set the initial covariance to a large value (large uncertainty)

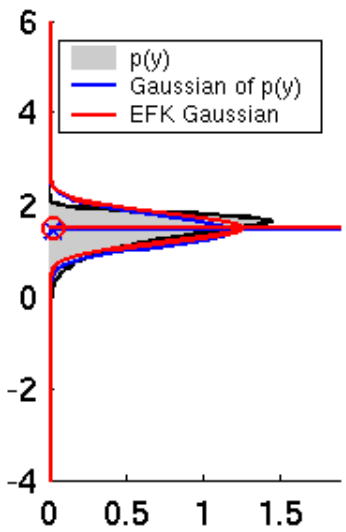
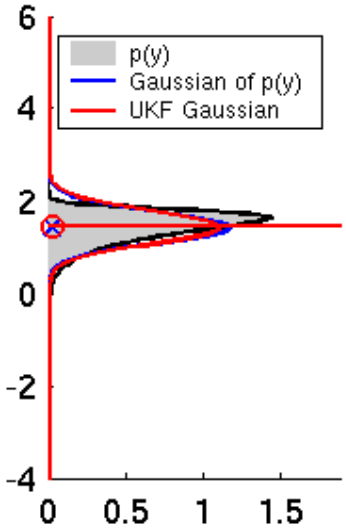
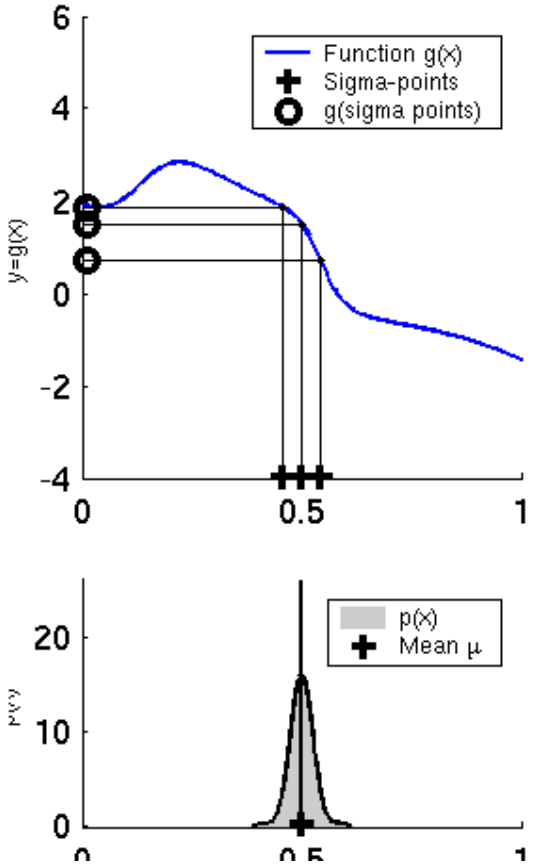
# Linearization via Unscented Transform (3)



EKF



UKF



# Unscented Transform

Sigma points

$$\chi^0 = \mu$$

matrix square root

$$\chi^i = \mu \pm \left(\sqrt{(n+\lambda)\Sigma}\right)_i$$

Weights

$$w_m^0 = \frac{\lambda}{n+\lambda} \qquad w_c^0 = \frac{\lambda}{n+\lambda} + (1-\alpha^2+\beta)$$

$$w_m^i = w_c^i = \frac{1}{2(n+\lambda)} \qquad \text{for } i = 1,\ldots,2n$$

Pass sigma points through nonlinear function

$$\psi^i = g(\chi^i)$$

Recover mean and covariance

$$\mu' = \sum_{i=0}^{2n} w_m^i \psi^i$$

$$\Sigma' = \sum_{i=0}^{2n} w_c^i (\psi^i - \mu)(\psi^i - \mu)^T$$

Unscented Transform on SE(3):
C. Hertzberg et al., "Integrating Generic Sensor Fusion Algorithms with Sound State Representations through Encapsulation of Manifolds", http://arxiv.org/pdf/1107.1119.pdf

# Cholesky Decomposition

- Symmetric positive definite matrices (such as covariances) can be factored into

$$\mathbf{\Sigma} = \mathbf{L}\mathbf{L}^T$$

using the Cholesky decomposition.

- The matrix square root is defined as

$$\sqrt{\mathbf{\Sigma}} := \mathbf{L}$$

# Unscented Kalman Filter – Prediction Step

1: **Unscented_Kalman_filter**$(\mu_{t-1}, \Sigma_{t-1}, u_t, z_t)$**:**

2: $\mathcal{X}_{t-1} = (\mu_{t-1} \quad \mu_{t-1} + \gamma\sqrt{\Sigma_{t-1}} \quad \mu_{t-1} - \gamma\sqrt{\Sigma_{t-1}})$

3: $\bar{\mathcal{X}}_t^* = g(u_t, \mathcal{X}_{t-1})$

4: $\bar{\mu}_t = \sum_{i=0}^{2n} w_m^{[i]} \bar{\mathcal{X}}_t^{*[i]}$

5: $\bar{\Sigma}_t = \sum_{i=0}^{2n} w_c^{[i]} (\bar{\mathcal{X}}_t^{*[i]} - \bar{\mu}_t)(\bar{\mathcal{X}}_t^{*[i]} - \bar{\mu}_t)^T + R_t$

# Unscented Kalman Filter – Correction Step

6: $\bar{\mathcal{X}}_t = (\bar{\mu}_t \quad \bar{\mu}_t + \gamma\sqrt{\bar{\Sigma}_t} \quad \bar{\mu}_t - \gamma\sqrt{\bar{\Sigma}_t})$

7: $\bar{\mathcal{Z}}_t = h(\bar{\mathcal{X}}_t)$

8: $\hat{z}_t = \sum_{i=0}^{2n} w_m^{[i]} \bar{\mathcal{Z}}_t^{[i]}$

9: $S_t = \sum_{i=0}^{2n} w_c^{[i]} (\bar{\mathcal{Z}}_t^{[i]} - \hat{z}_t)(\bar{\mathcal{Z}}_t^{[i]} - \hat{z}_t)^T + Q_t$

10: $\bar{\Sigma}_t^{x,z} = \sum_{i=0}^{2n} w_c^{[i]} (\bar{\mathcal{X}}_t^{[i]} - \bar{\mu}_t)(\bar{\mathcal{Z}}_t^{[i]} - \hat{z}_t)^T$

11: $K_t = \bar{\Sigma}_t^{x,z} \; S_t^{-1}$

12: $\mu_t = \bar{\mu}_t + K_t(z_t - \hat{z}_t)$

13: $\Sigma_t = \bar{\Sigma}_t - K_t \; S_t \; K_t^T$

14: *return* $\mu_t, \Sigma_t$

# Summary: State Estimation

- Probabilistic state estimation
  - Uncertainty in measurement and state-transition
  - Bayes filter

- Kalman filters
  - Linear KF for continuous Gaussian state variables and Gaussian model noise
  - Linear KF is optimal (if model is valid)
  - Extended KF: allow for non-linear measurement and state-transition models
  - Unscented KF: improve on linearization in EKF through unscented transform
  - Efficient filtering techniques

# What we will cover today

- Introduction to vision-based state estimation and control

- State estimation
  - Bayes Filter
  - Extended Kalman Filter
  - Unscented Kalman Filter

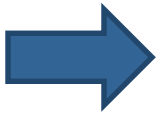
- **Feedback Control**
  - **PID Control**
  - **Cascaded Control**

# Feedback Control

- Given:
  - Goal state $x_{\text{des}}$
  - Measured state (feedback) $z$
- Wanted:
  - Control signal $u$ to reach goal state

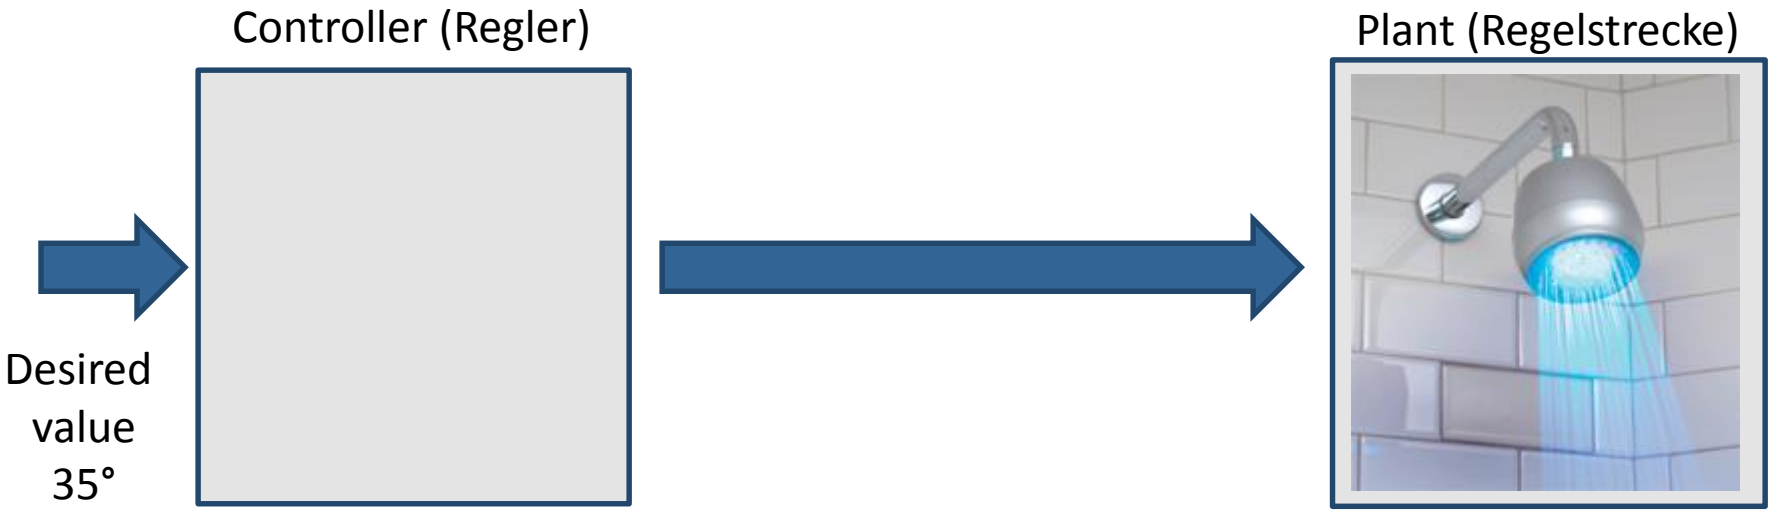
- How to compute the control signal?

# Feedback Control - Generic Idea

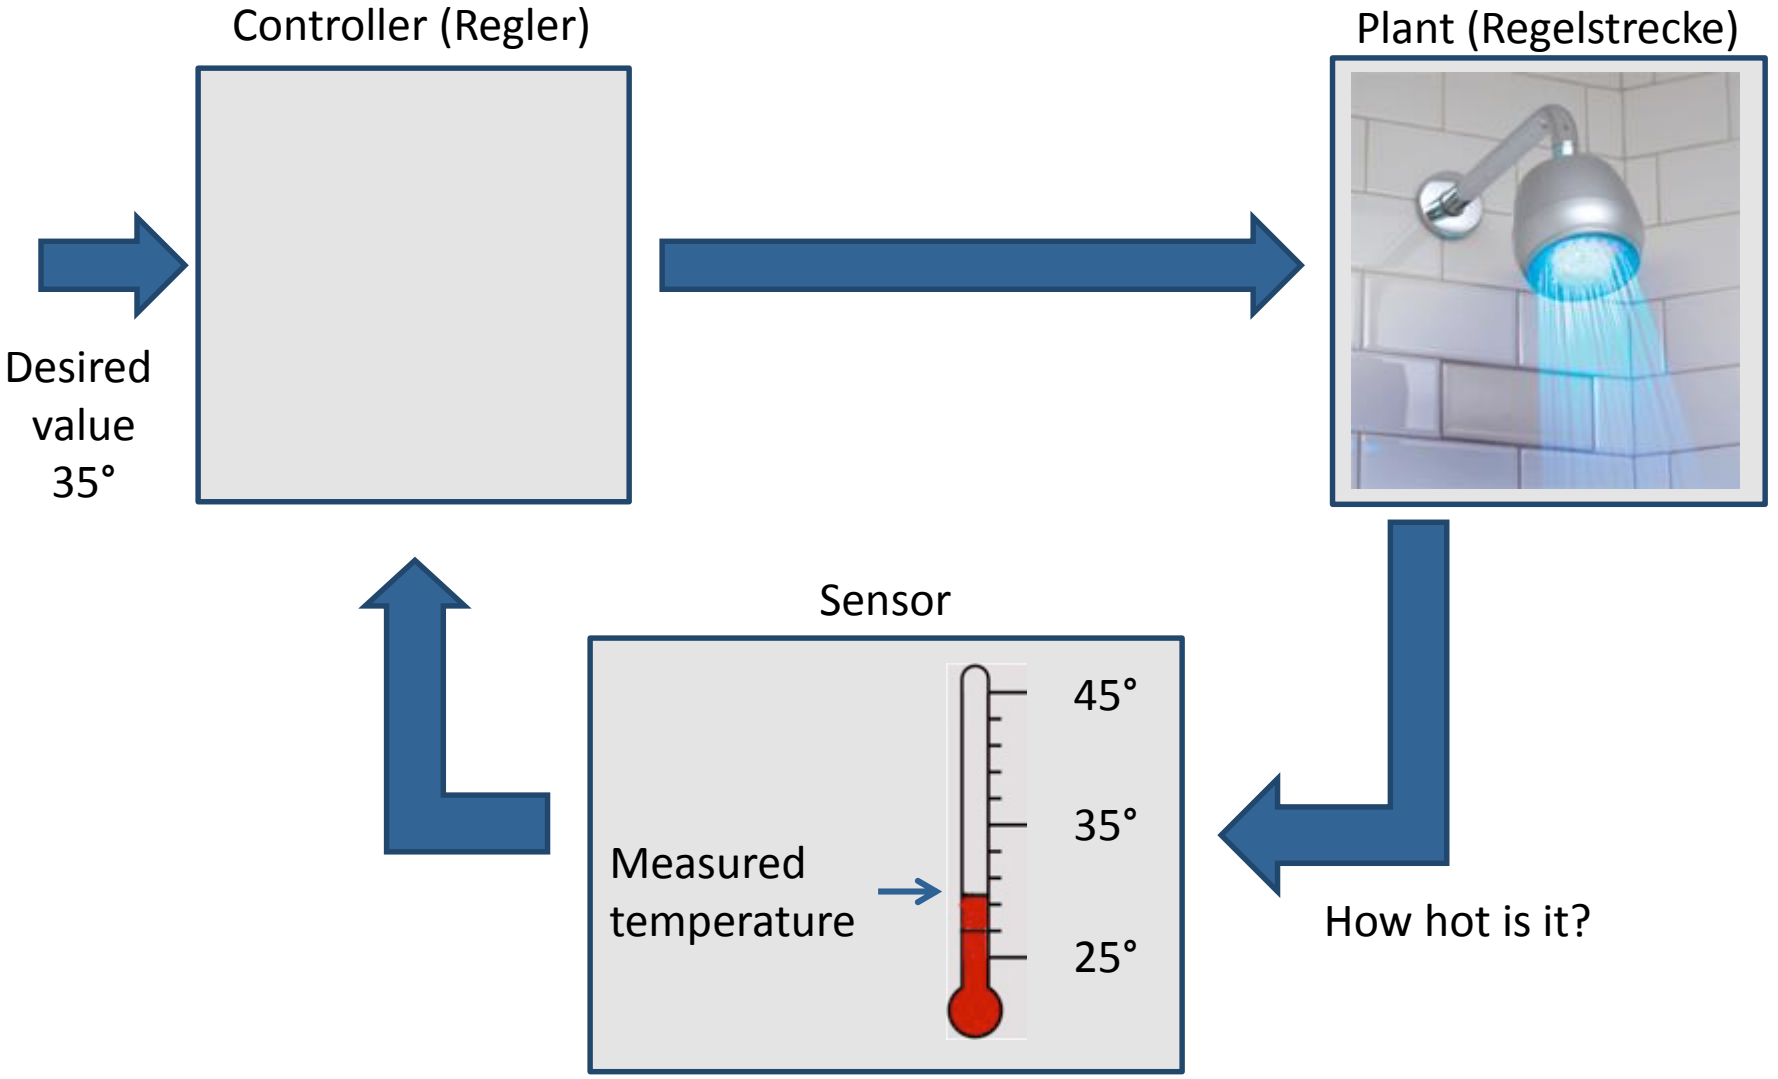


Desired value 35°

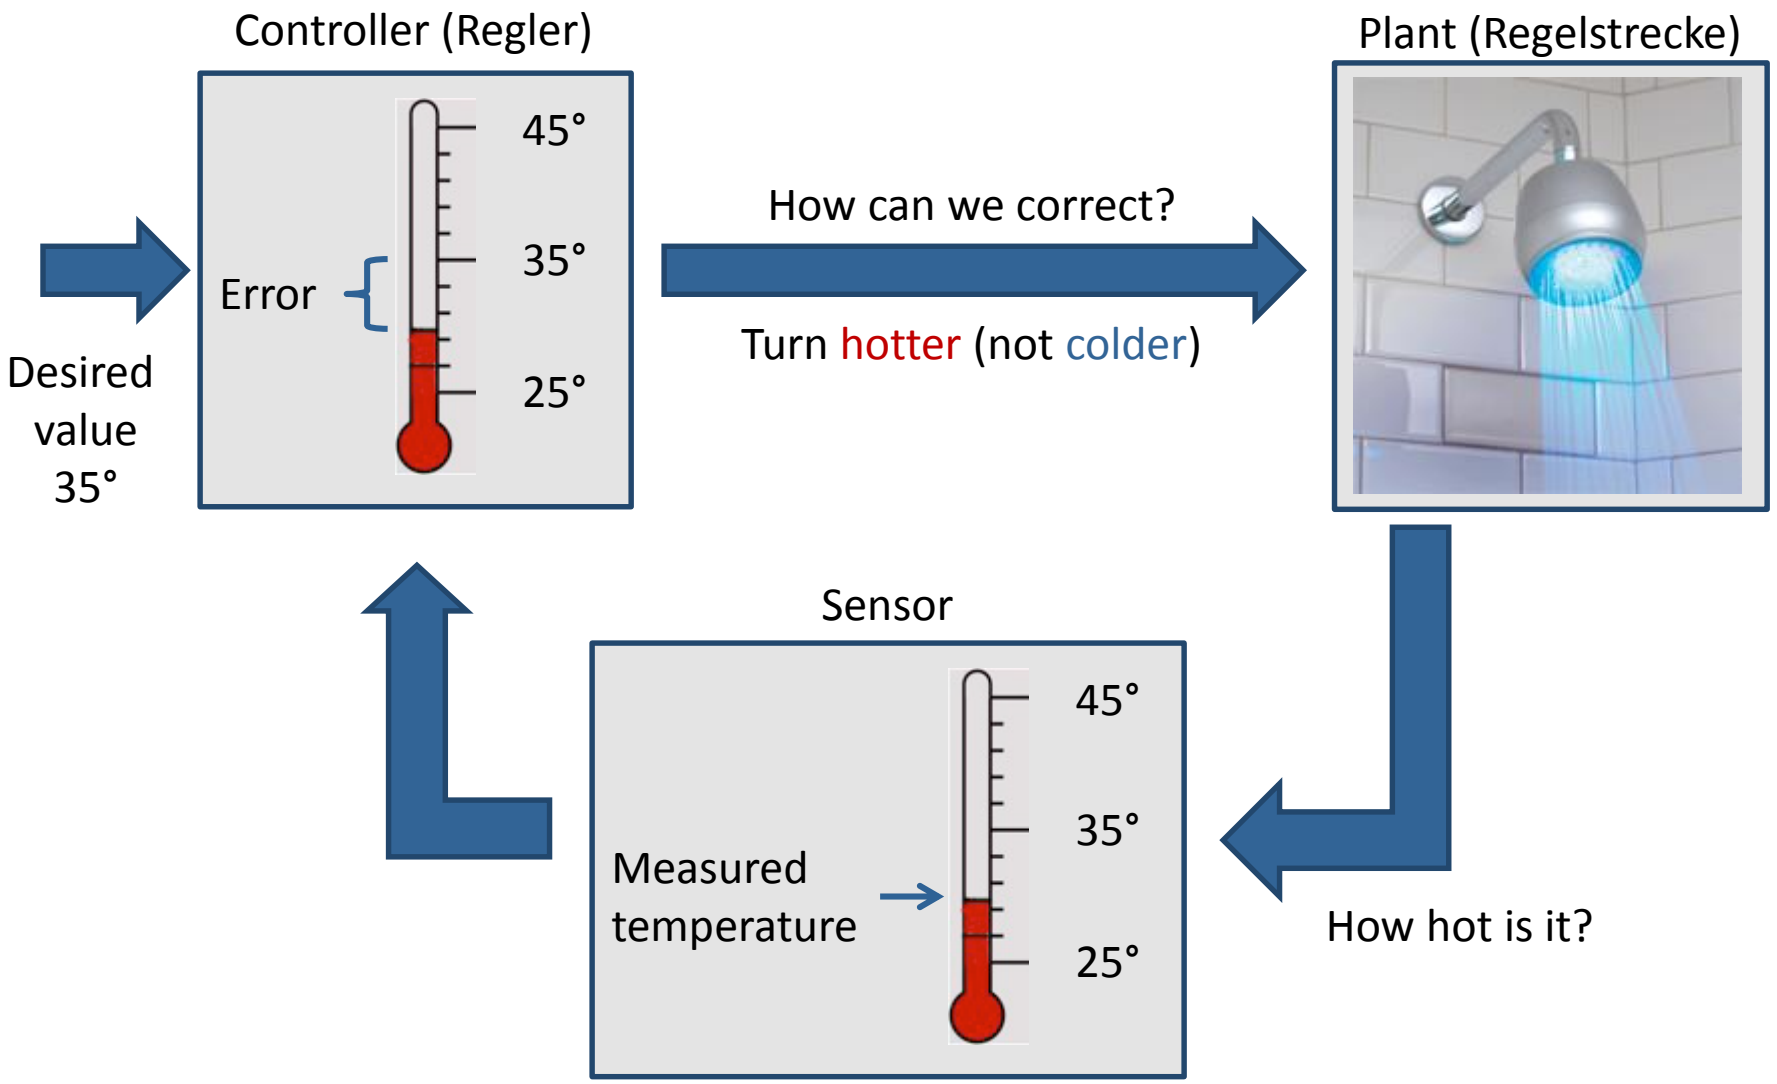
# Feedback Control - Generic Idea



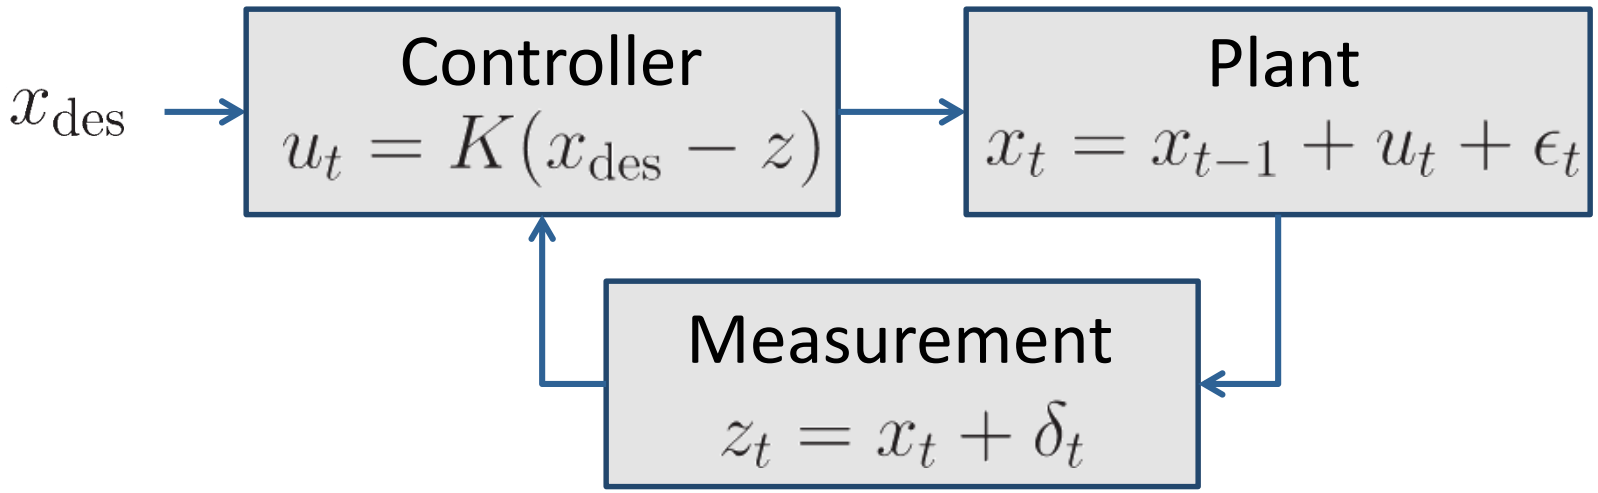
# Feedback Control - Generic Idea

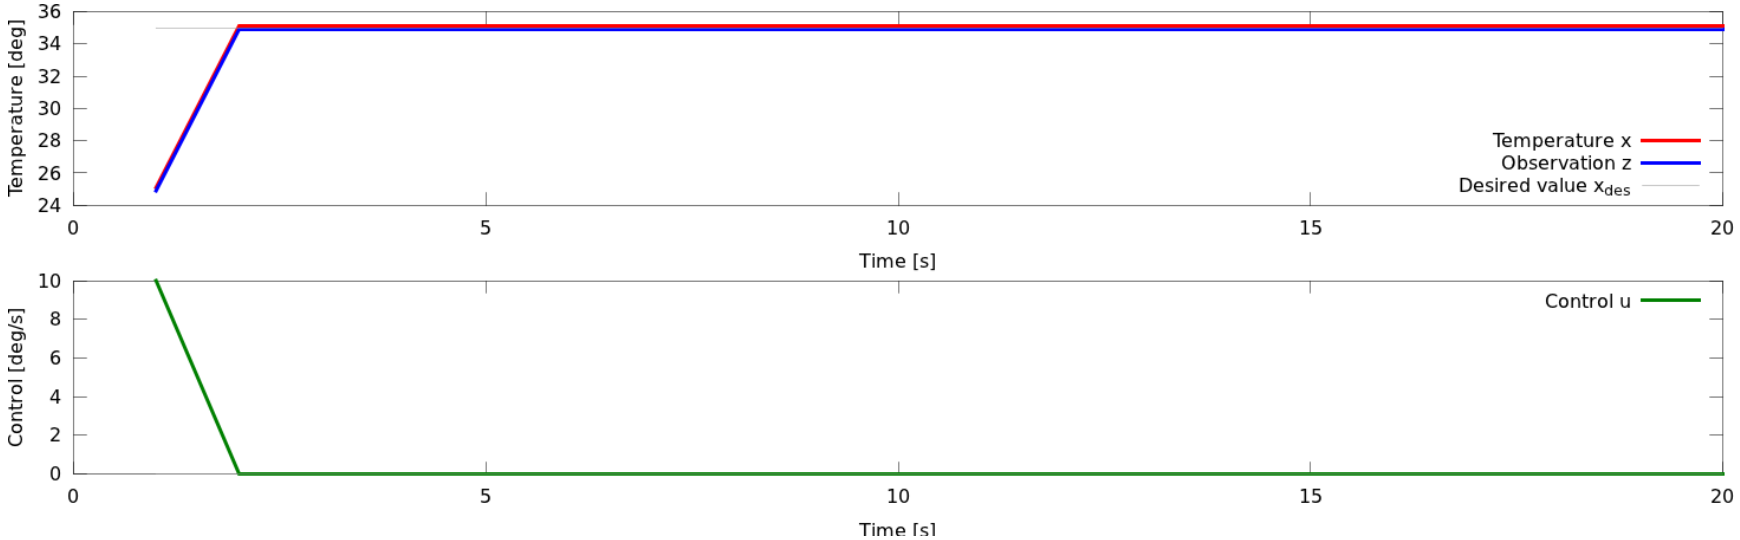


# Feedback Control - Generic Idea



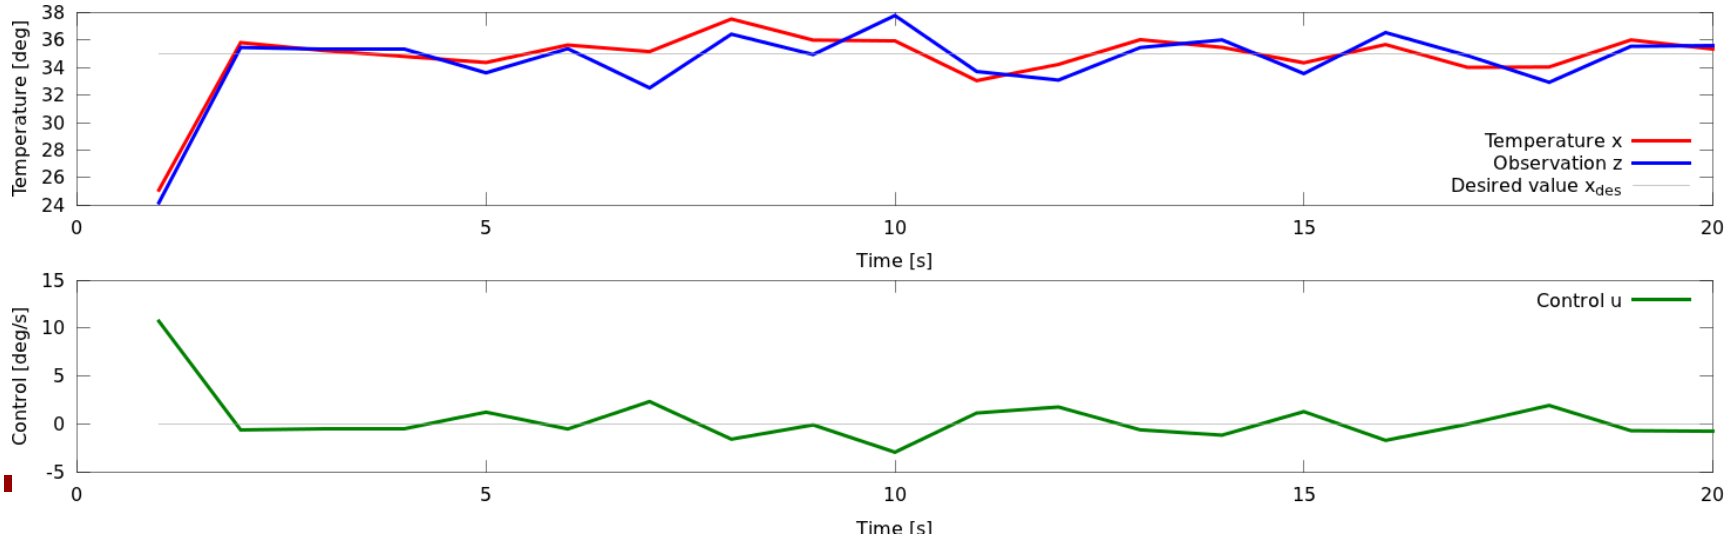
# Feedback Control - Example





# Measurement Noise

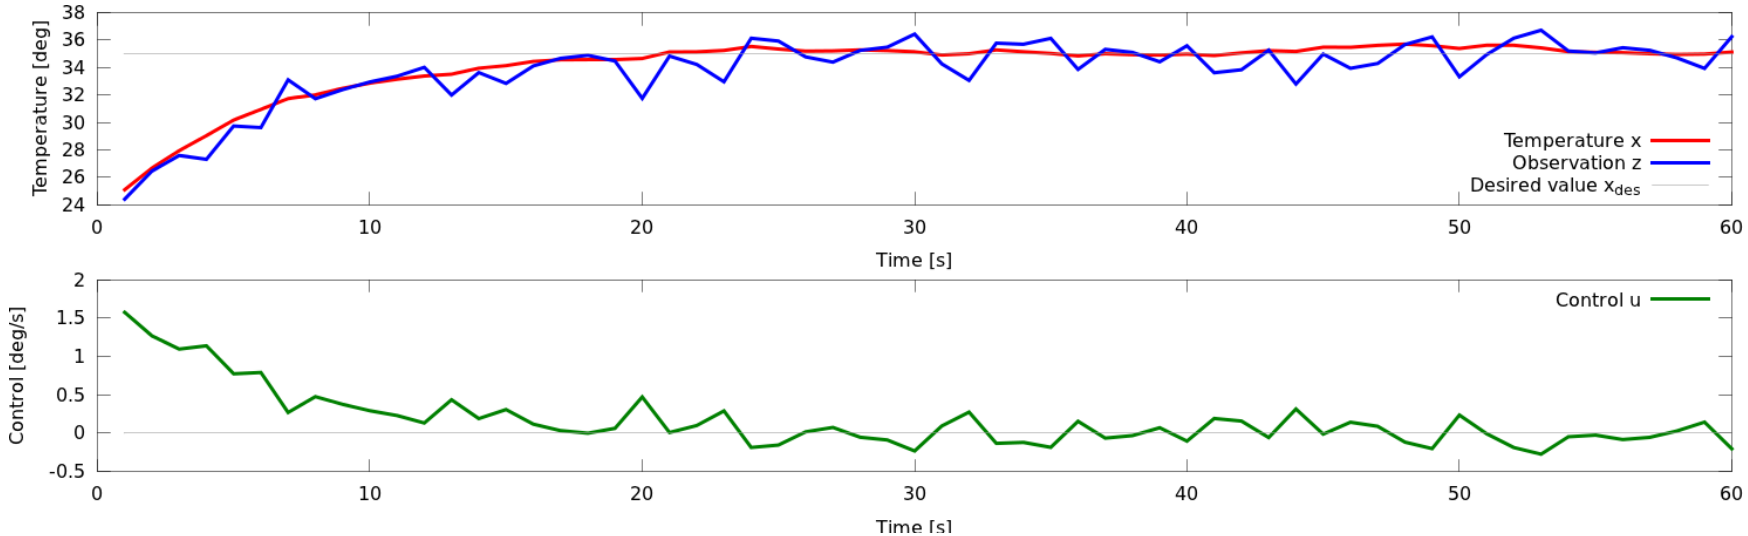
- What effect has noise in the measurements?



- How can we fix this?

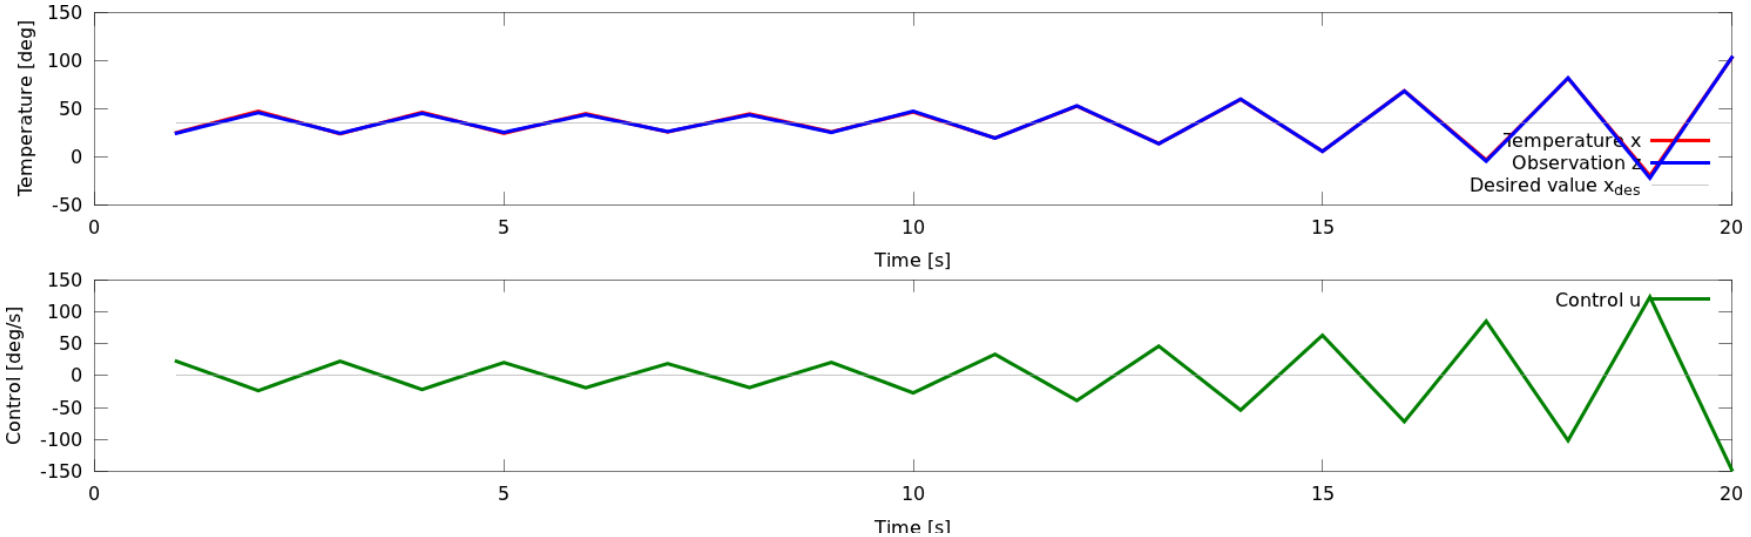
# Proper Control with Measurement Noise

- Lower the gain… (K=0.15)



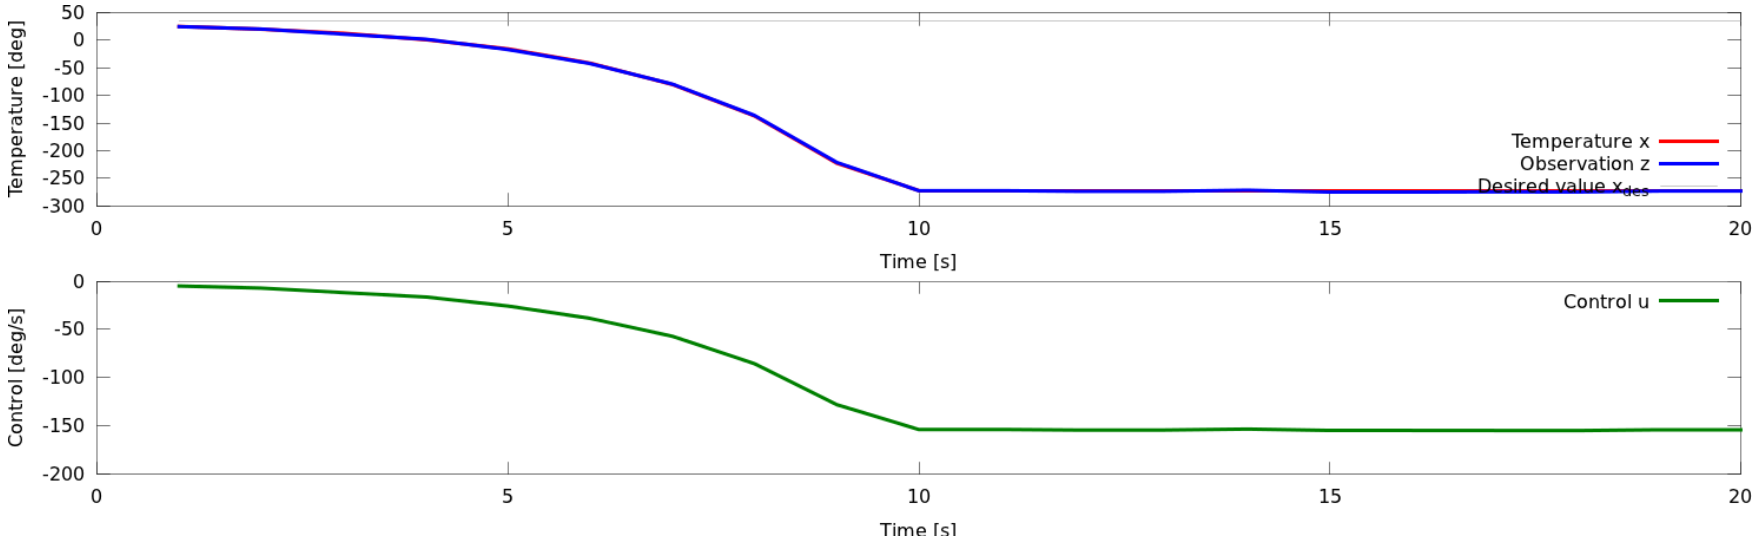
# What do High Gains do?

- High gains are always problematic (K=2.15)



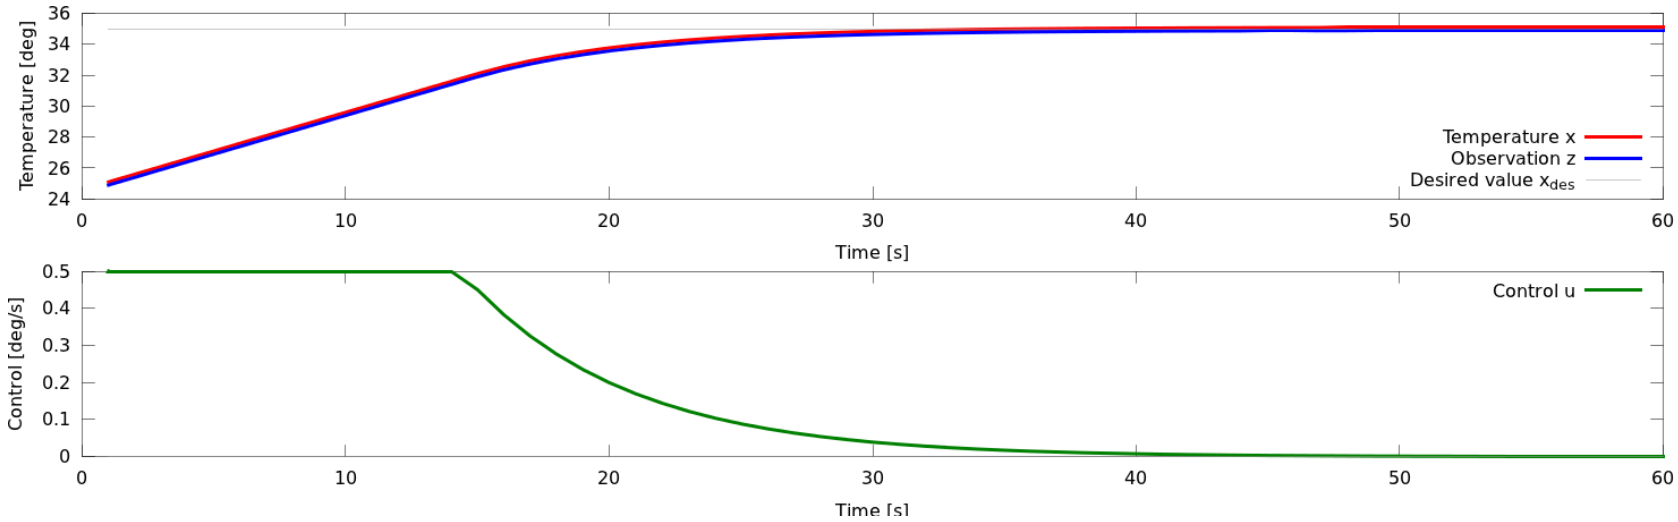
# What happens if sign is messed up?

- Check K=-0.5

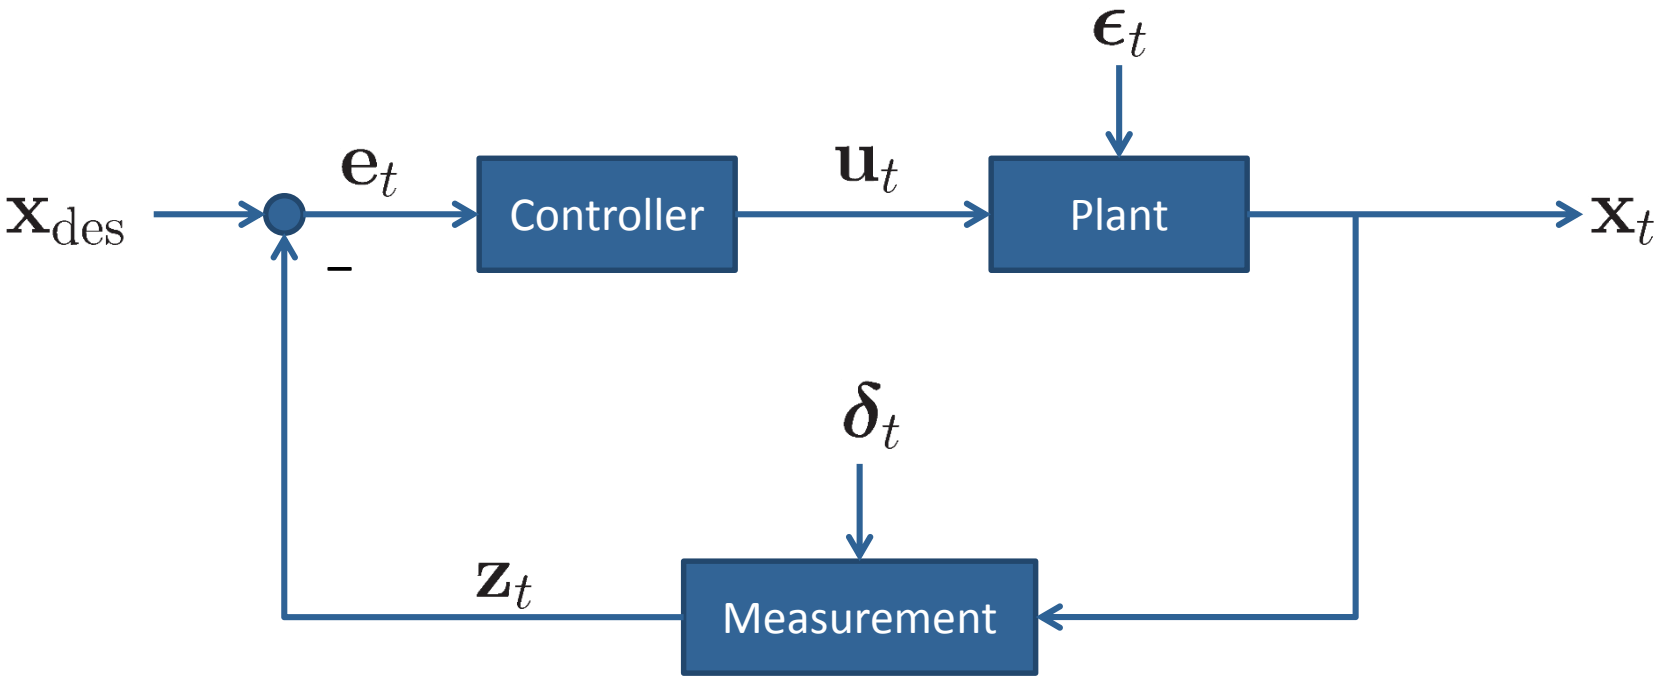


# Saturation

- In practice, often the set of admissible controls u is bounded
- This is called (control) saturation

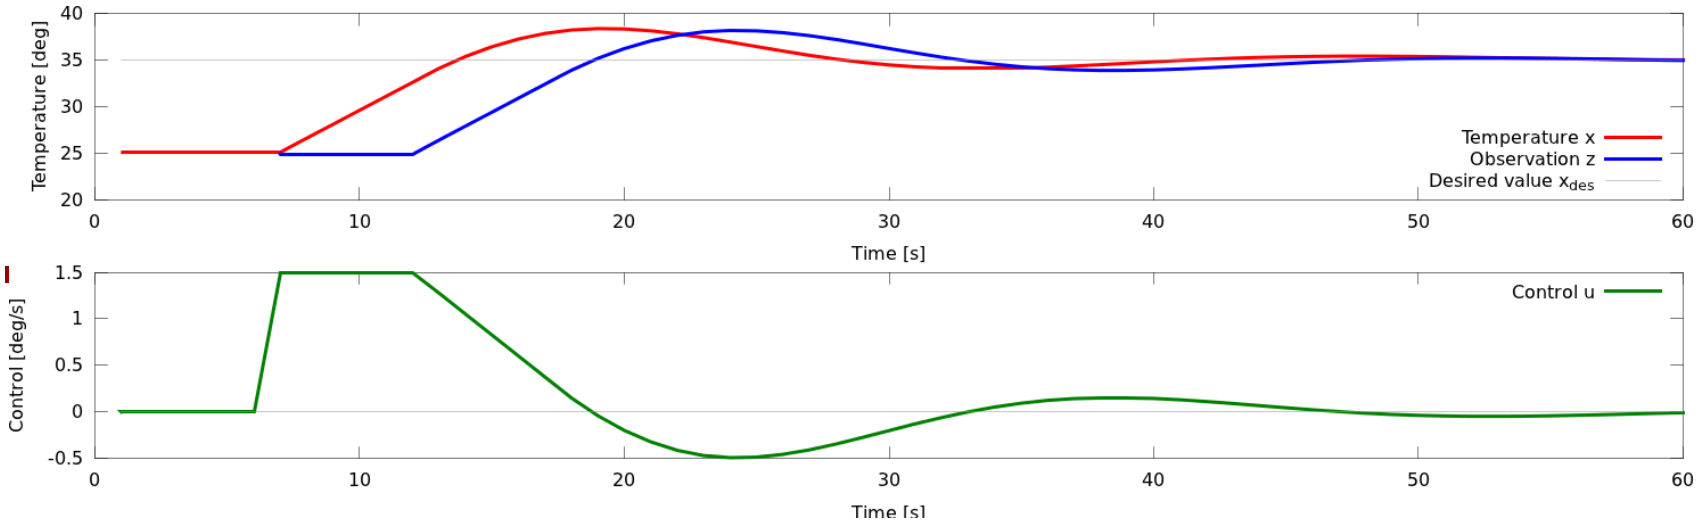


# Block Diagram



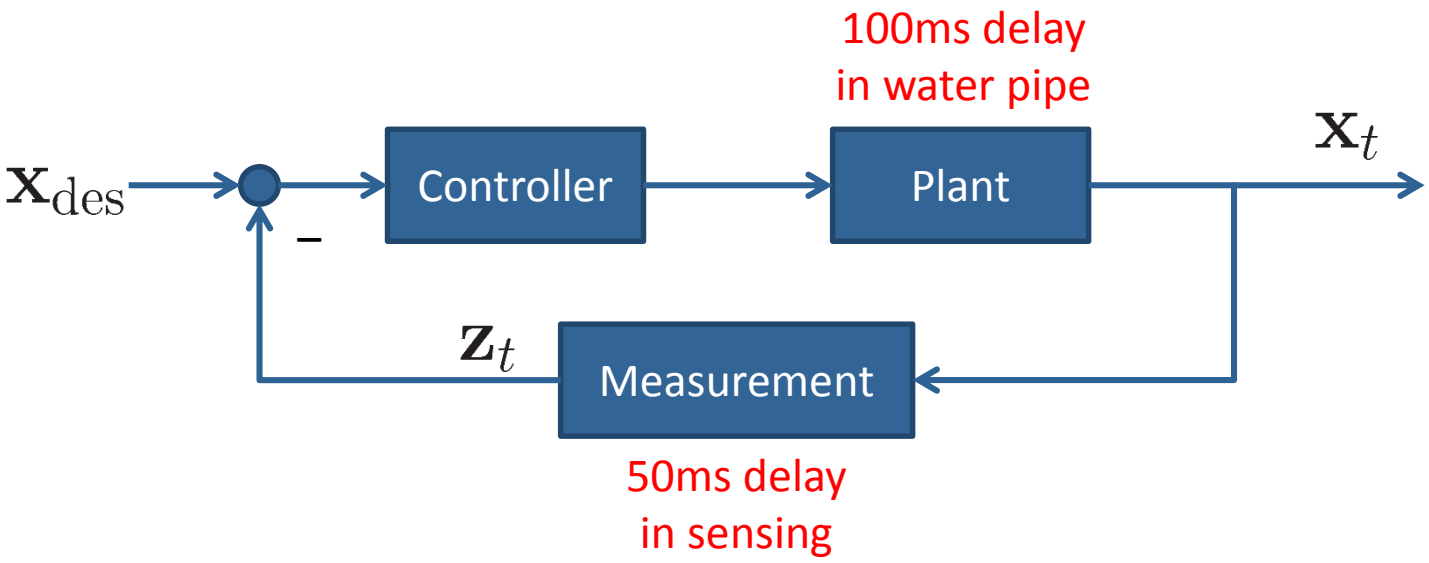
# Delays

- In practice most systems have delays
- Can lead to overshoots/oscillations/de-stabilization



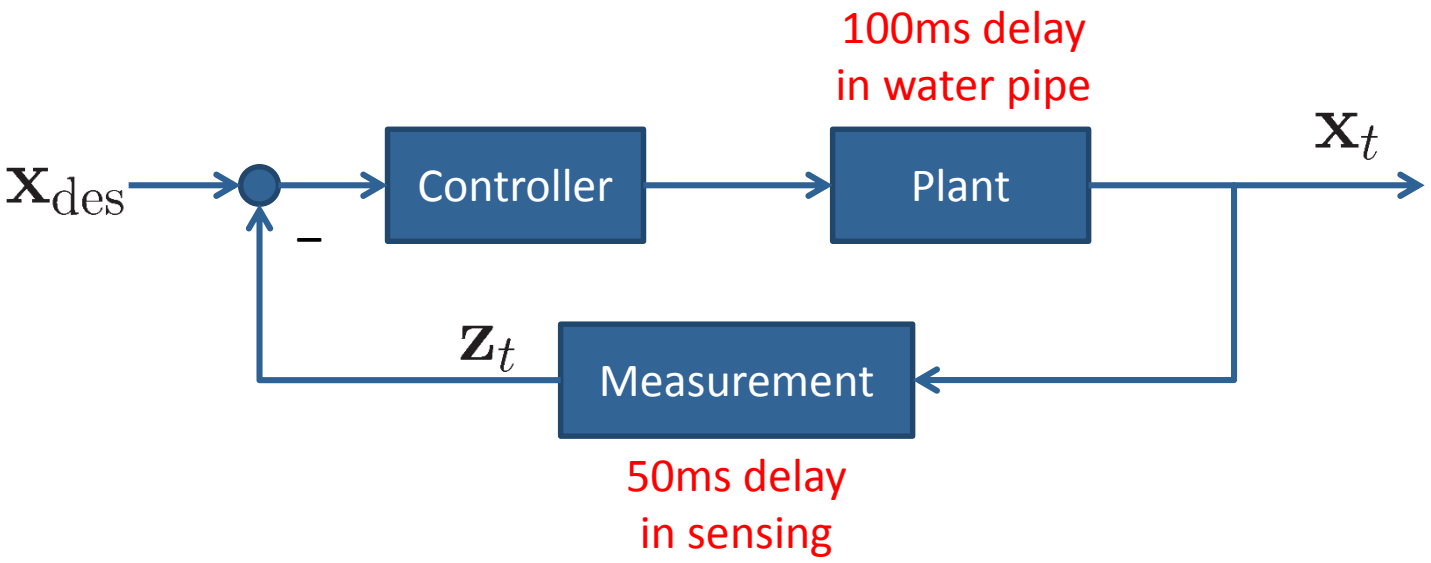
# Delays

- What is the total dead time of this system?



# Delays

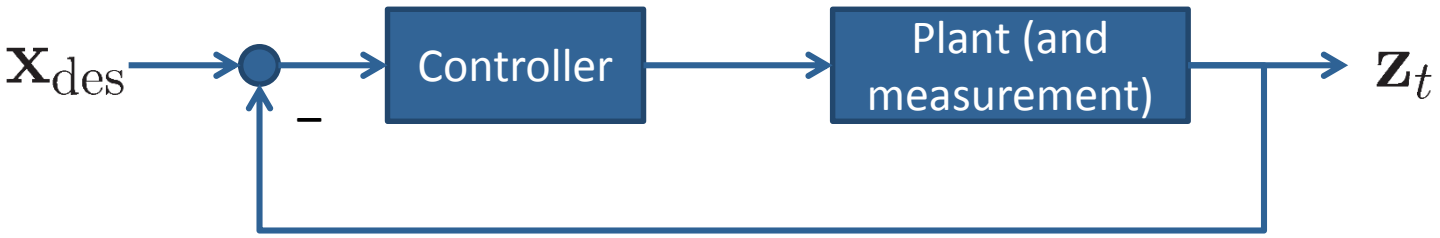
- What is the total dead time of this system?



- Can we distinguish delays in the measurement from delays in actuation?

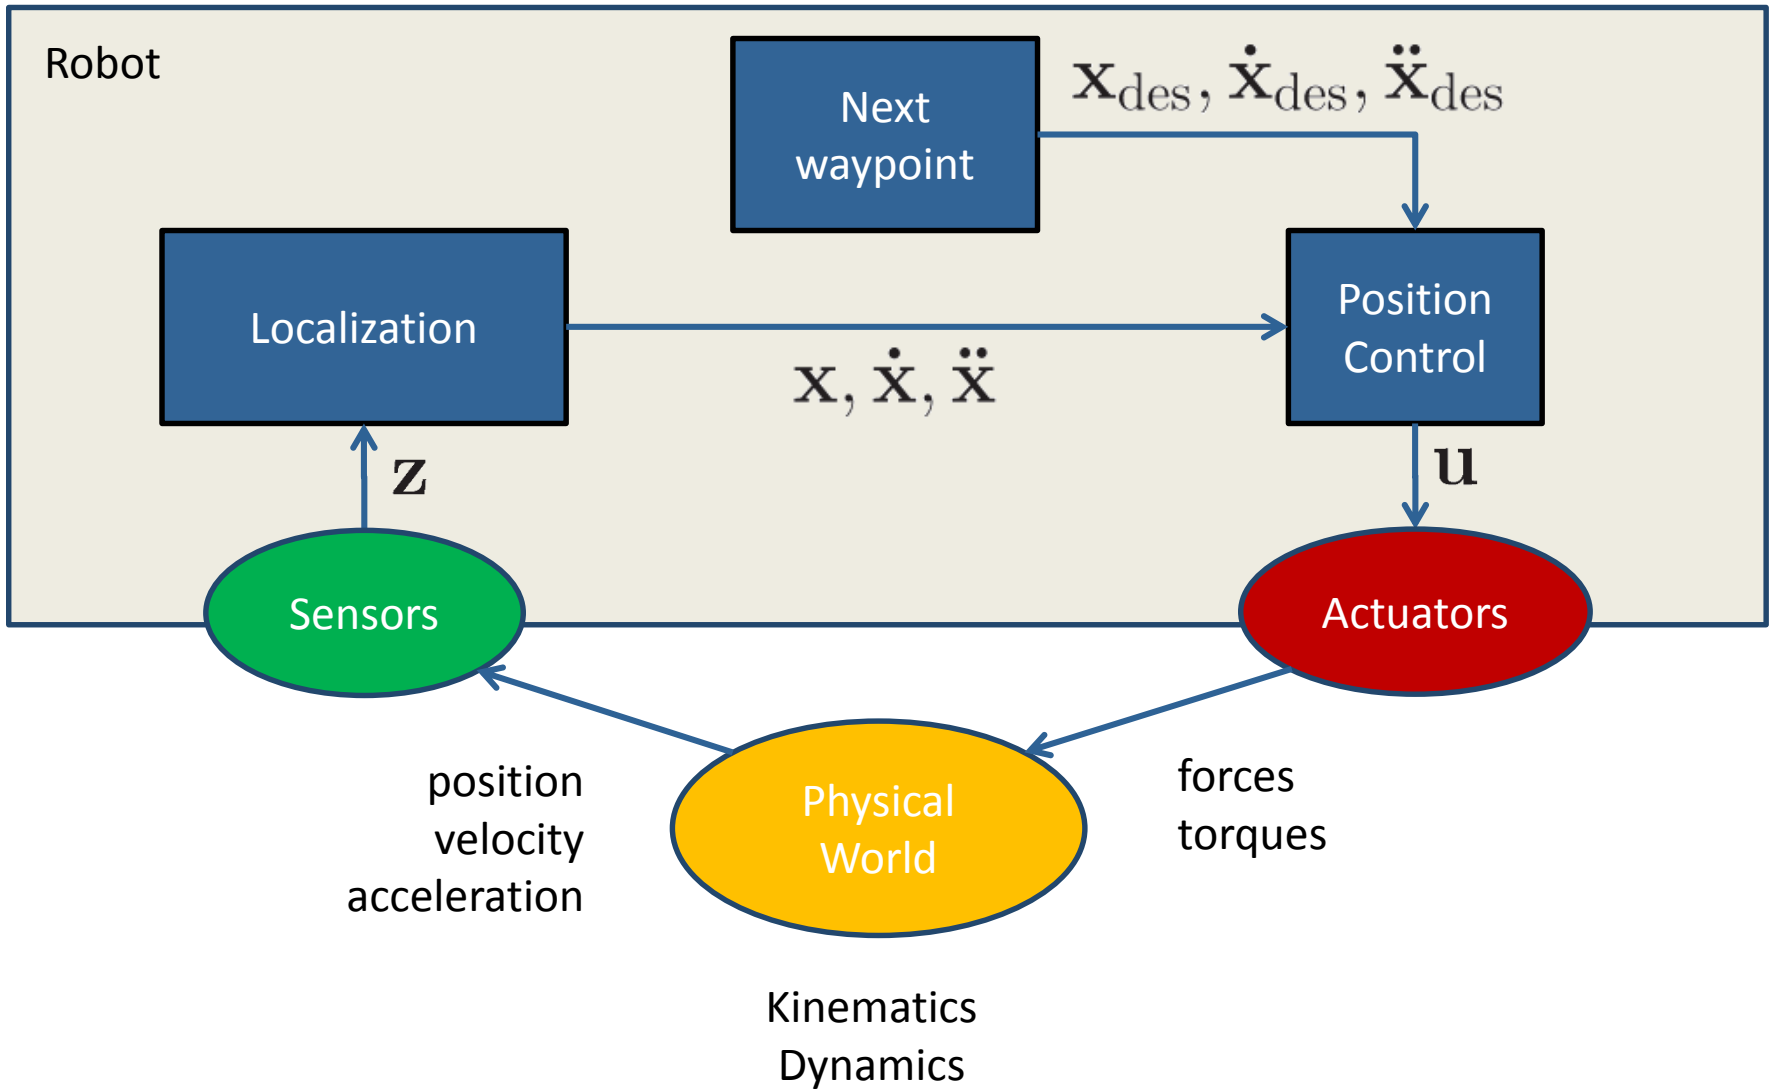
# Delays

- What is the total dead time of this system?



- Can we distinguish delays in the measurement from delays in actuation? No!

# Position Control



# Rigid Body Kinematics

- Consider a rigid body
- Free floating in 1D space, no gravity
- In each time instant, we can apply a force F
- Results in acceleration $\ddot{x} = F/m$
- Desired position $x_{\text{des}} = 1$

# P Control

- What happens for this control law?

$$u_t = K(x_{\text{des}} - x_{t-1})$$

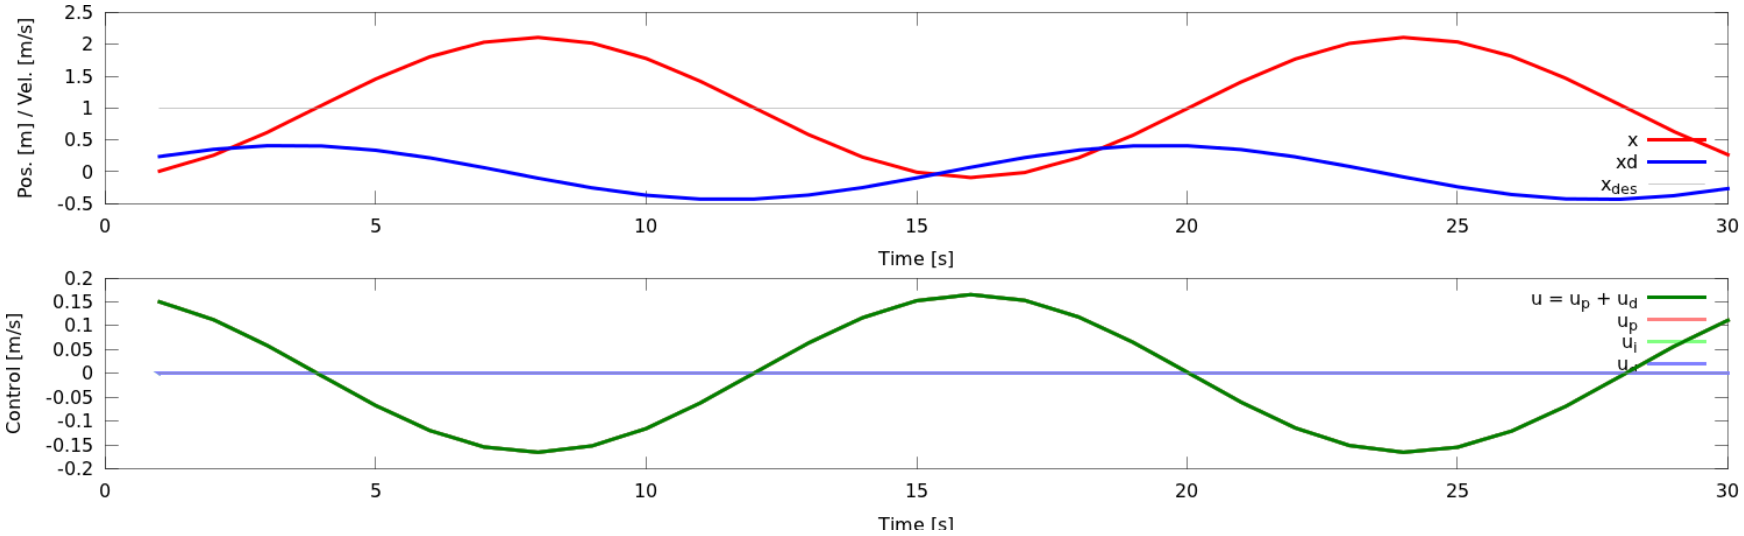
- This is called proportional control

# P Control

- What happens for this control law?

$$u_t = K(x_{\text{des}} - x_{t-1})$$

- This is called proportional control

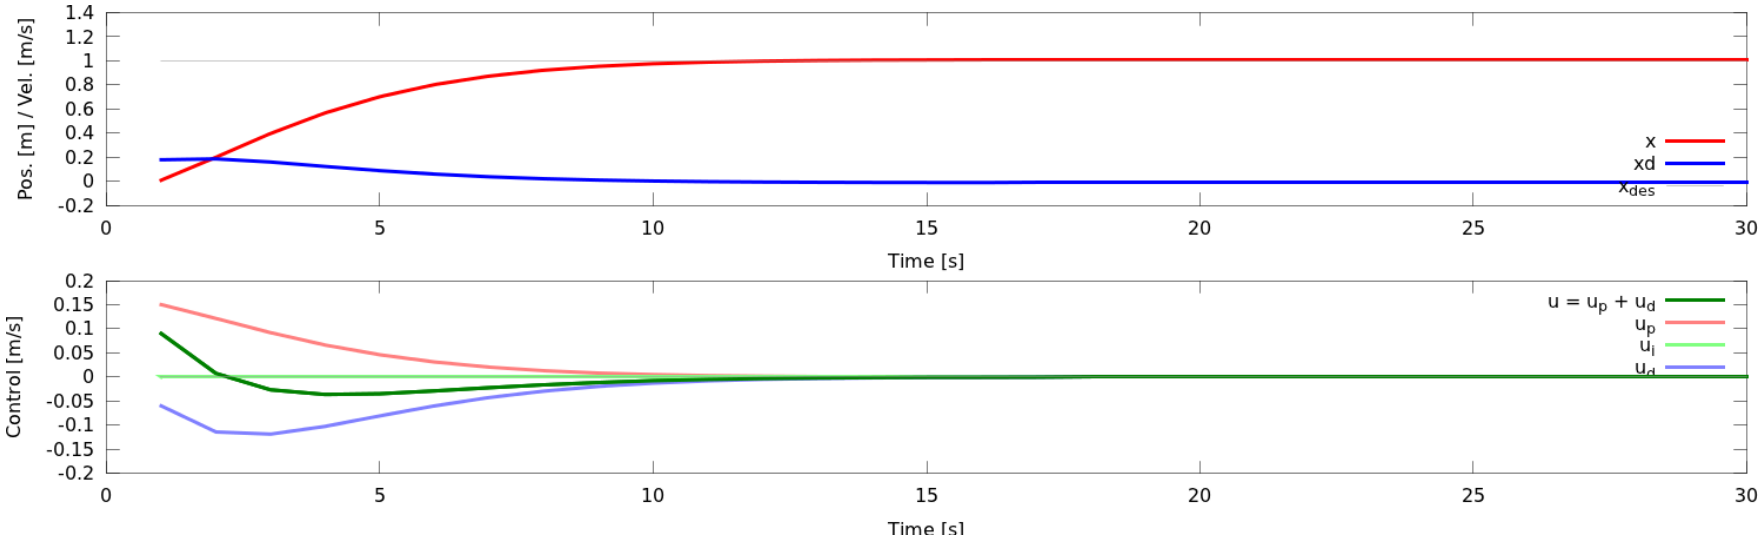


# PD Control

- What happens for this control law?

$$u_t = K_P(x_{\text{des}} - x_{t-1}) + K_D(\dot{x}_{\text{des}} - \dot{x}_{t-1})$$

- Proportional-Derivative control

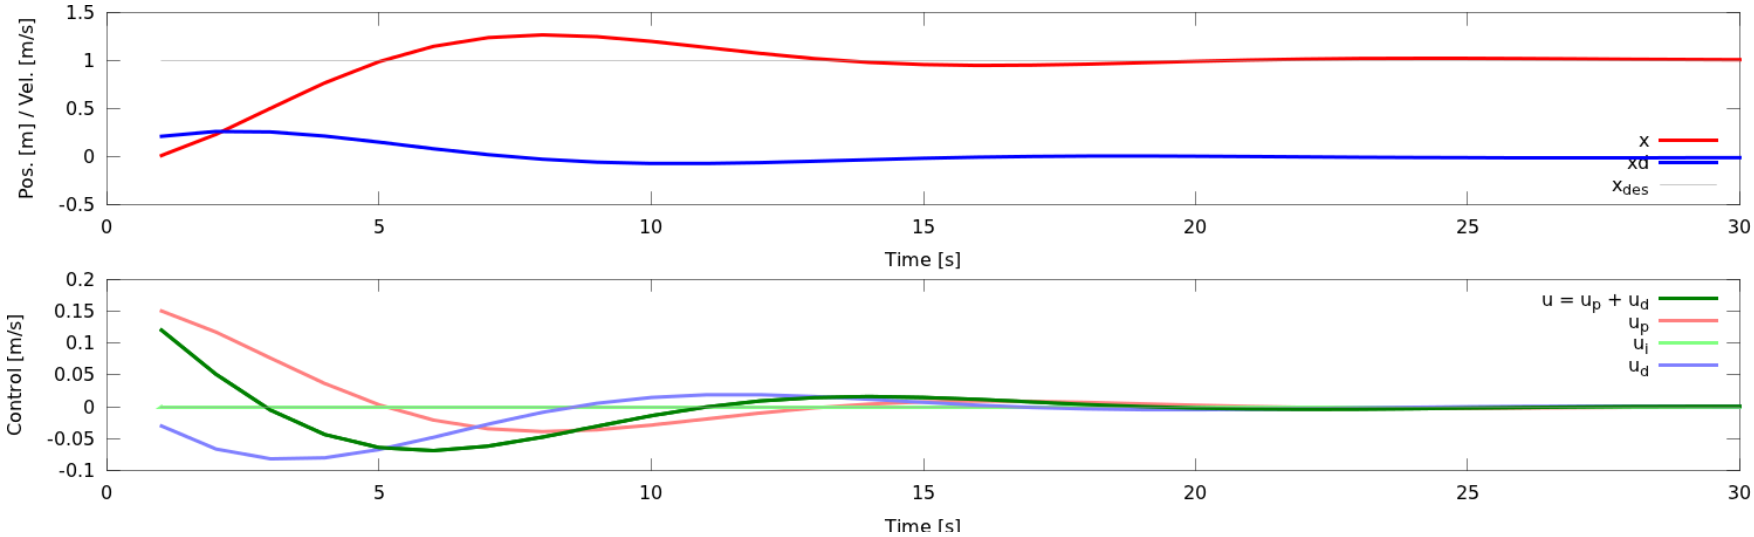


# PD Control

- What happens for this control law?

$$u_t = K_P(x_{\text{des}} - x_{t-1}) + K_D(\dot{x}_{\text{des}} - \dot{x}_{t-1})$$

- What if we set **higher** gains?

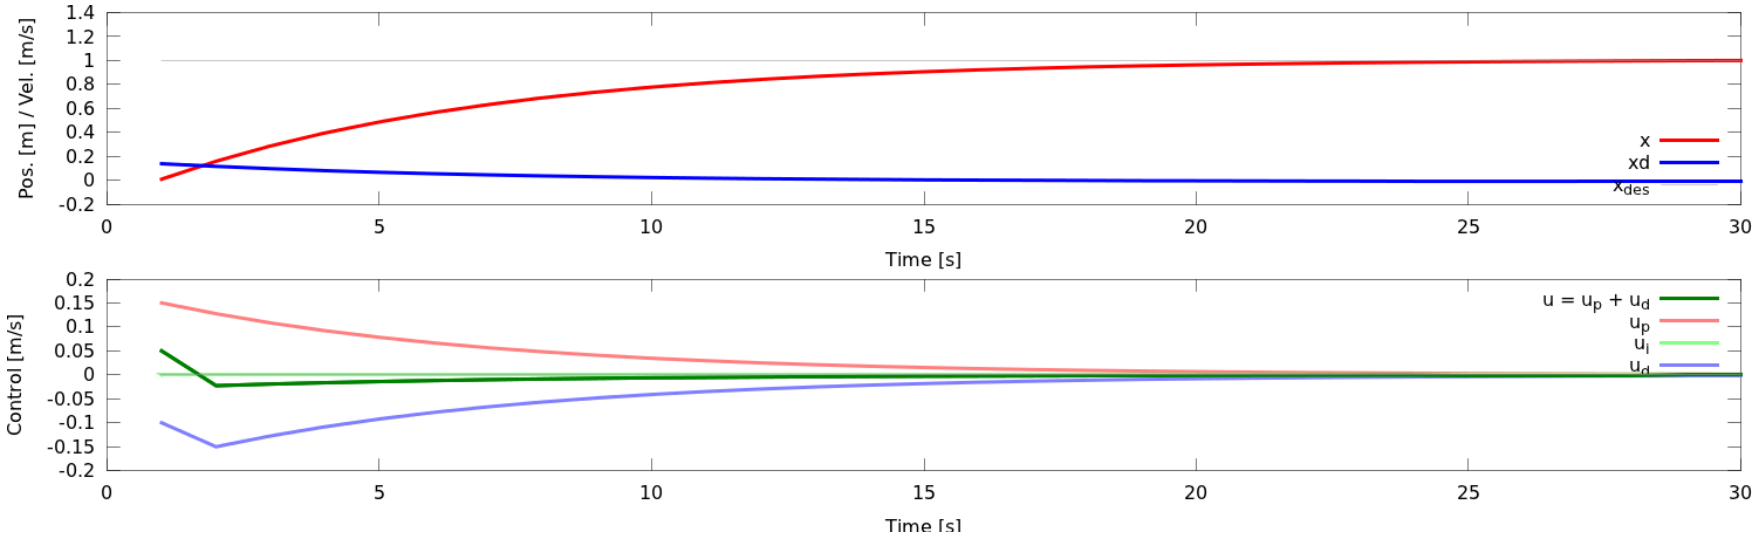


# PD Control

- What happens for this control law?

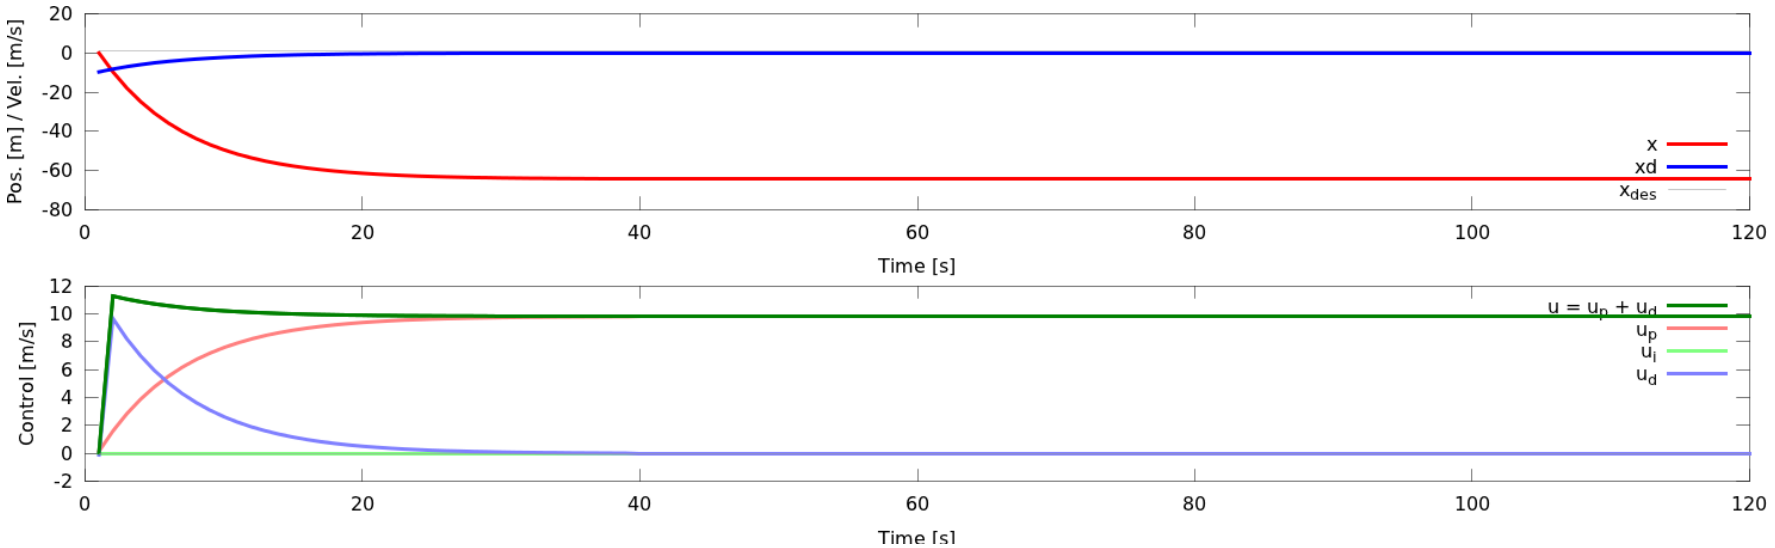
$$u_t = K_P(x_{\text{des}} - x_{t-1}) + K_D(\dot{x}_{\text{des}} - \dot{x}_{t-1})$$

- What if we set **lower** gains?



# PD Control

- What happens when we add gravity?

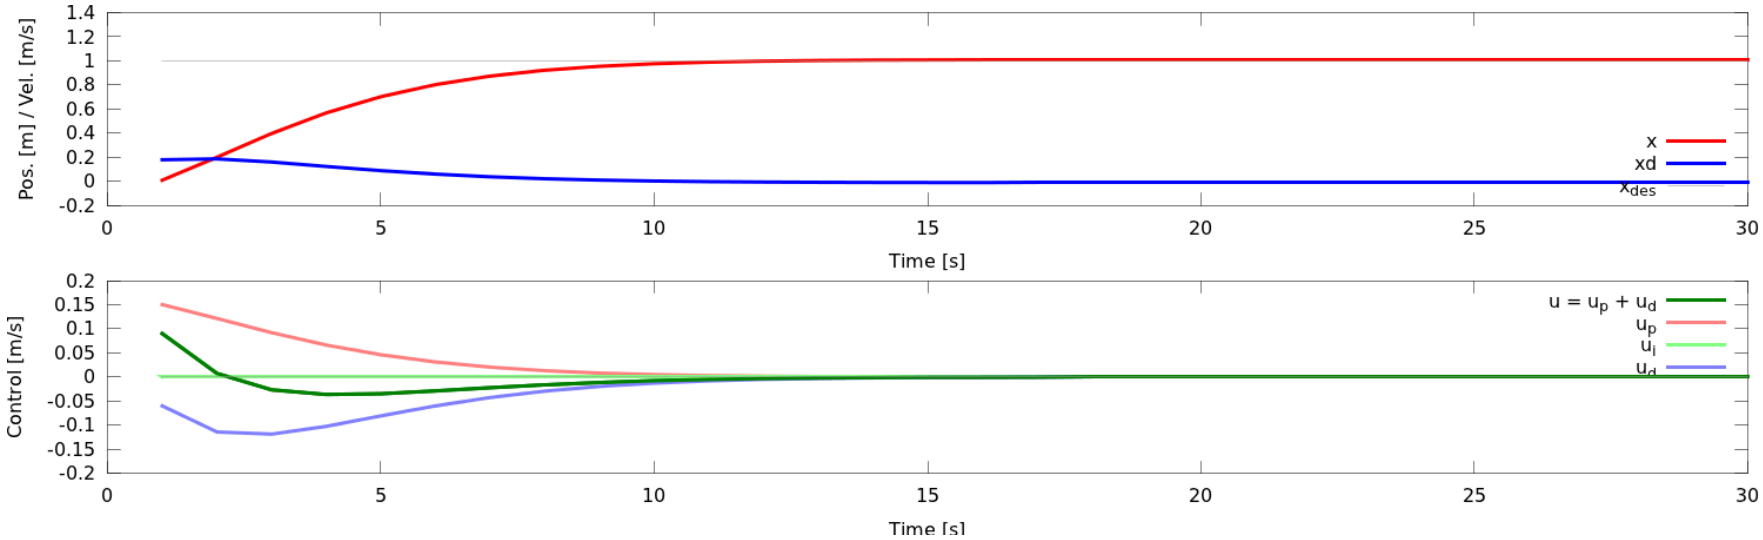


# Gravity compensation

- Add as an additional term in the control law

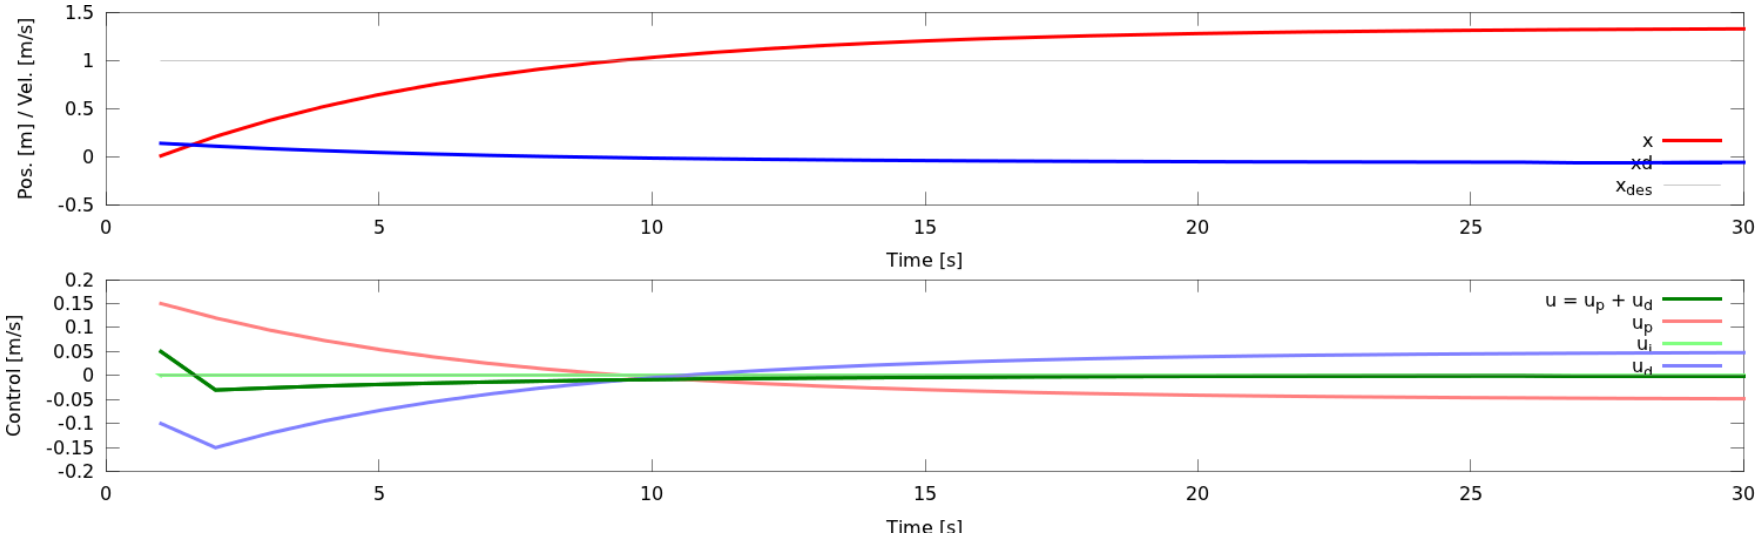
$$u_t = K_P(x_{\text{des}} - x_{t-1}) + K_D(\dot{x}_{\text{des}} - \dot{x}_{t-1}) + F_{\text{grav}}$$

- Any known (inverse) dynamics can be included



# PD Control

- What happens when we have systematic errors? (control/sensor noise with non-zero mean)
- Example: unbalanced quadrocopter, wind, …
- Does the robot ever reach its desired location?

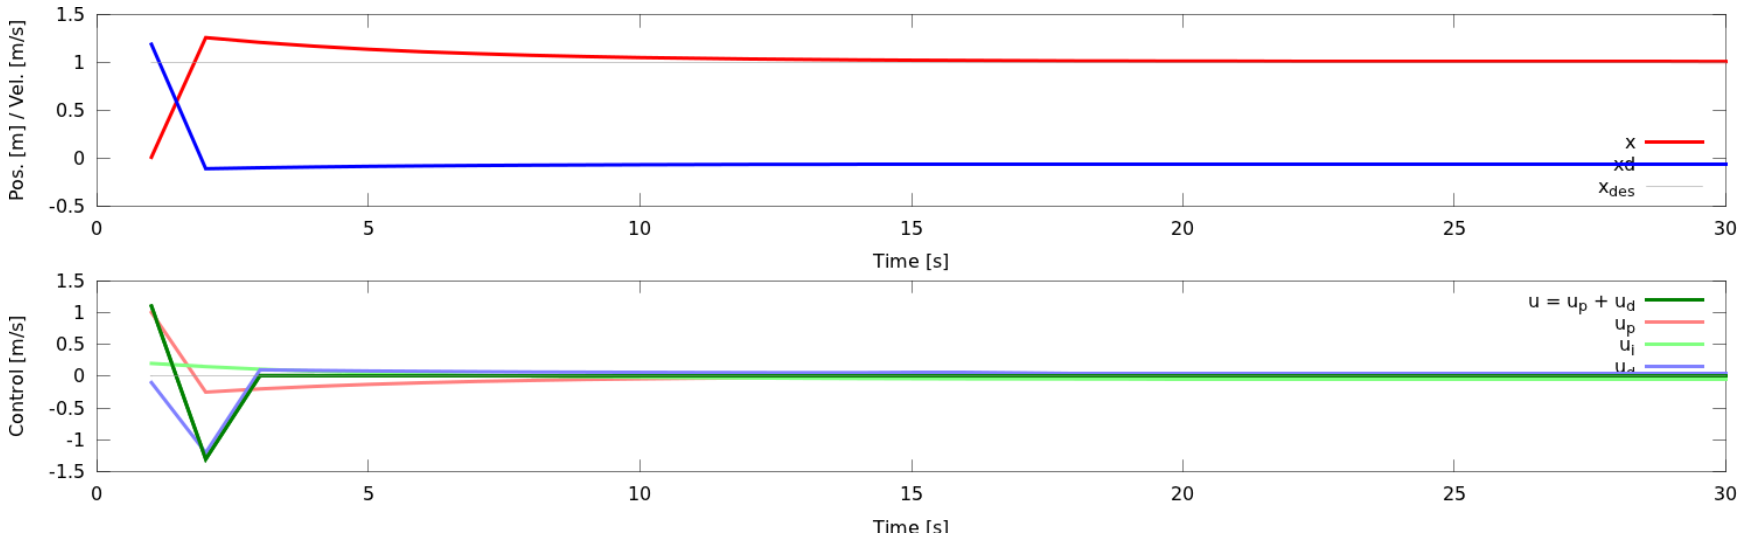


# PID Control

- Idea: Estimate the system error (bias) by integrating the error

$$u_t = K_P(x_{\text{des}} - x_t) + K_D(\dot{x}_{\text{des}} - \dot{x}_t) + K_I \int_{-\infty}^{t} x_{des} - x_t \mathrm{d}t$$

- Proportional+Derivative+Integral Control



# PID Control

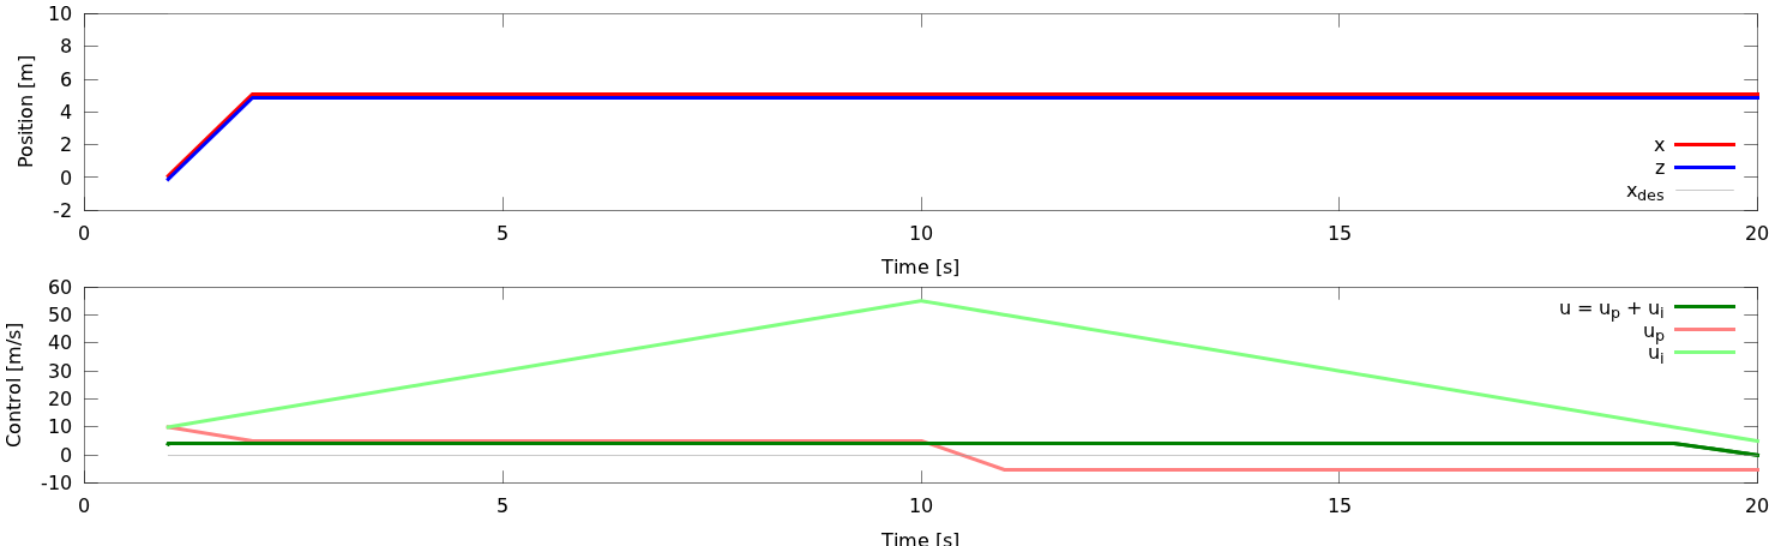
- Idea: Estimate the system error (bias) by integrating the error

$$u_t = K_P(x_{\text{des}} - x_t) + K_D(\dot{x}_{\text{des}} - \dot{x}_t) + K_I \int_{-\infty}^{t} x_{des} - x_t \mathrm{d}t$$

- Proportional+Derivative+Integral Control
- For steady state systems, this can be reasonable
- Otherwise, it may create havoc or even disaster (wind-up effect)

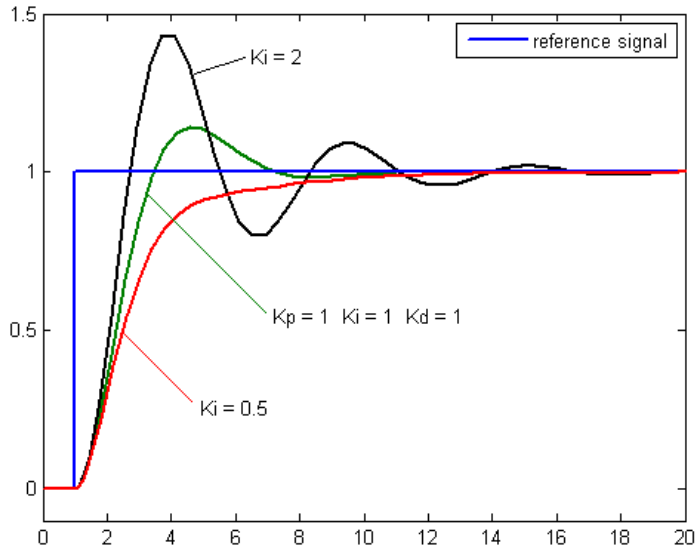
# Example: Wind-up effect

- Quadrocopter gets stuck in a tree → does not reach steady state
- What is the effect on the I-term?



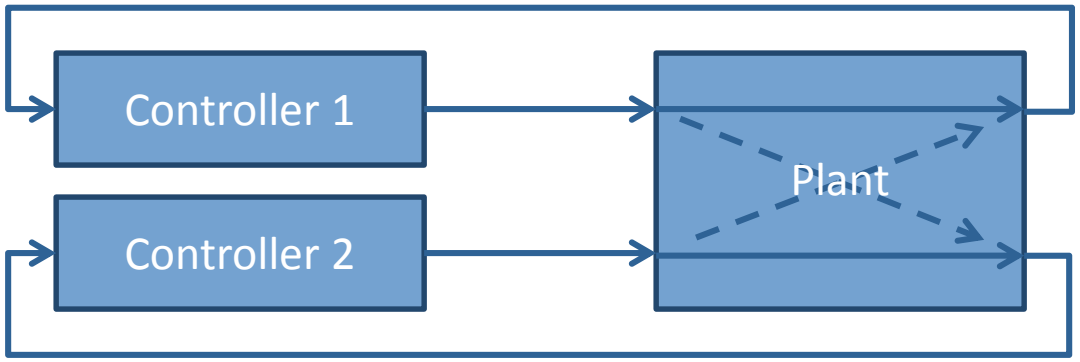
# How to Choose the Coefficients?

- Gains too large: overshooting, oscillations
- Gains too small: long time to converge
- Heuristic methods exist
- In practice, often tuned manually

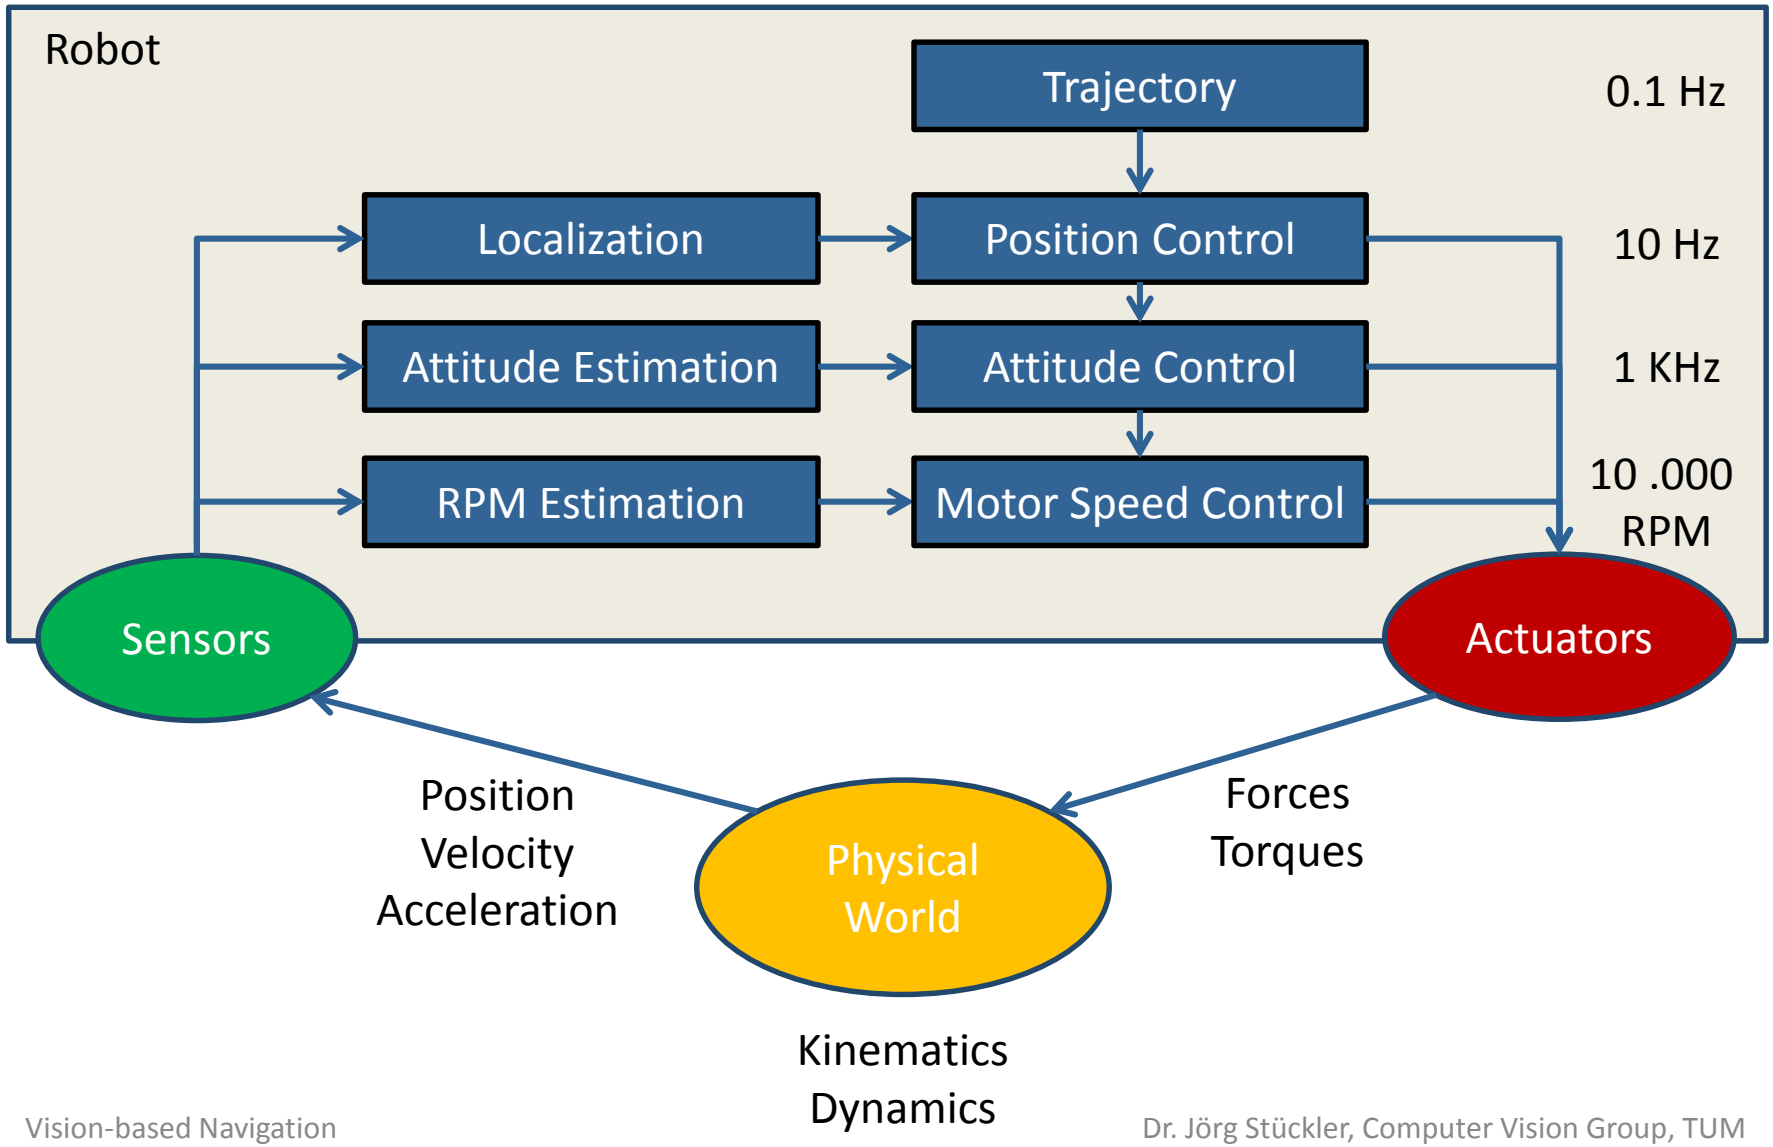


# De-coupled Control

- So far, we considered only single-input, single-output systems (SISO)
- Real systems have multiple inputs + outputs
- MIMO (multiple-input, multiple-output)
- In practice, control is often de-coupled



# Cascaded Control



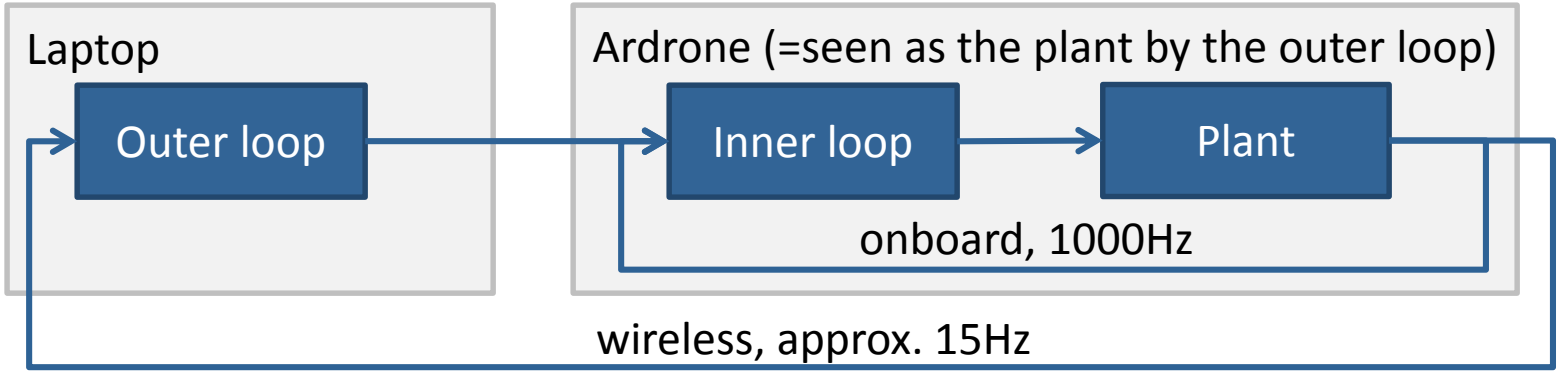
# Assumptions of Cascaded Control

- Dynamics of inner loops is so fast that it is not visible from outer loops
- Dynamics of outer loops is so slow that it appears as static to the inner loops

# Example: Ardrone

Cascaded control

- Inner loop runs on embedded PC and stabilizes flight
- Outer loop runs externally and implements position control



# Ardrone: Inner Control Loop

- Plant input: motor torques

$$\mathbf{u}_{\text{inner}} = \begin{pmatrix} \tau_1 & \tau_2 & \tau_3 & \tau_4 \end{pmatrix}^\top$$

- Plant output: roll, pitch, yaw rate, z velocity

$$\mathbf{x}_{\text{inner}} = \begin{pmatrix} \omega_x & \omega_y & \omega_z & z \end{pmatrix}^\top$$

attitude
(measured using gyro + accelerometer)

altitude
(measured using ultrasonic distance sensor + attitude)

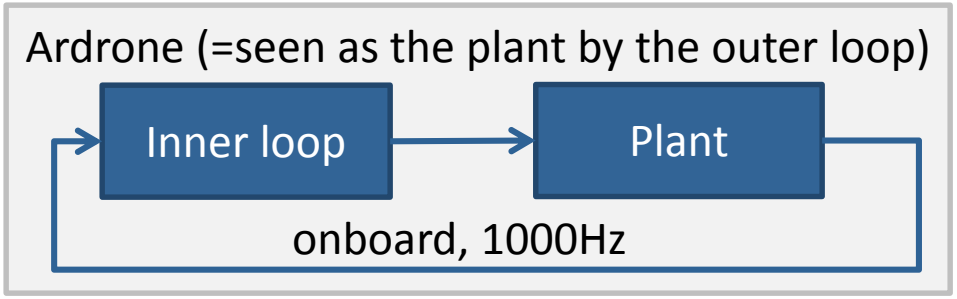
# Ardrone: Inner Control Loop

- Plant input: motor torques

$$\mathbf{u}_{\text{inner}} = \begin{pmatrix} \tau_1 & \tau_2 & \tau_3 & \tau_4 \end{pmatrix}^\top$$

- Plant output: roll, pitch, yaw rate, z velocity

$$\mathbf{x}_{\text{inner}} = \begin{pmatrix} \omega_x & \omega_y & \omega_z & z \end{pmatrix}^\top$$



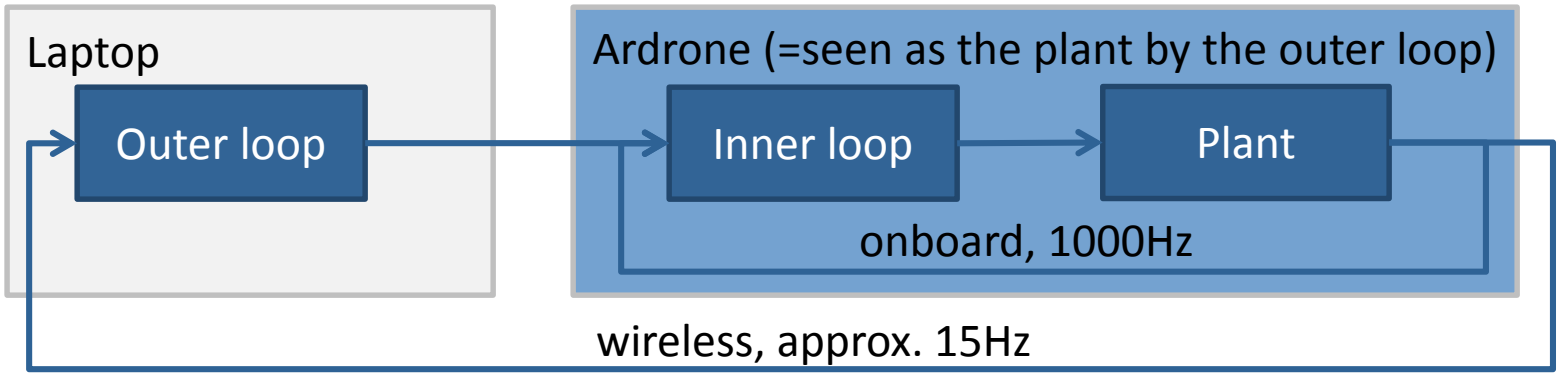
# Ardrone: Outer Control Loop

- Outer loop sees inner loop as a plant (black box)
- Plant input: roll, pitch, yaw rate, z velocity

- Plant output:

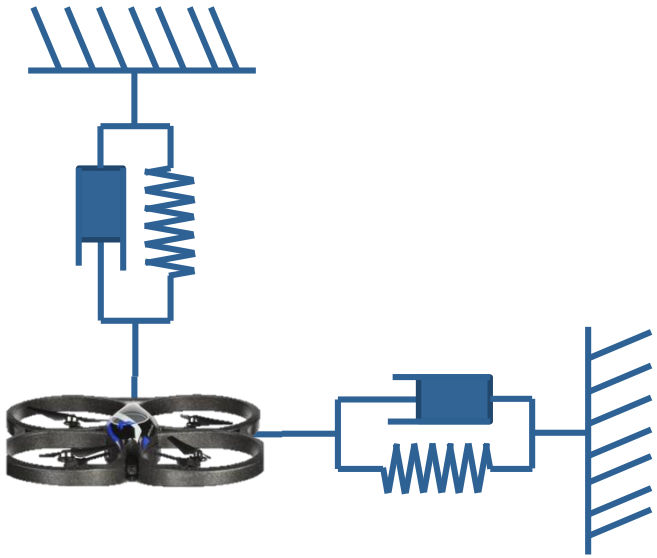
$$\mathbf{u}_{\text{outer}} = \begin{pmatrix} \omega_x & \omega_y & \dot{\omega}_z & \dot{z} \end{pmatrix}^\top$$

$$\mathbf{x}_{\text{outer}} = \begin{pmatrix} x & y & z & \psi \end{pmatrix}^\top$$



# Mechanical Equivalent

- PD Control is equivalent to adding spring-dampers between the desired values and the current position



# Advanced Control Techniques

What other control techniques do exist?

- Adaptive control
- Robust control
- Optimal control
- Linear-quadratic regulator (LQR)
- Reinforcement learning
- Inverse reinforcement learning
- ... and many more

# Summary: Feedback Control

PID control is the most used control technique in practice

- P control → simple proportional control, often enough
- PI control → can compensate for bias (e.g., wind)
- PD control → can be used to reduce overshoot (e.g., when acceleration is controlled)
- PID control → all of the above

# Lessons Learned Today

- Probabilistic state estimation techniques
  - Linear Kalman Filter, Extended KF, Unscented KF
  - Efficient filtering techniques, well suited for onboard processing
- How to control a system using PID controllers
  - Intuitive control laws
  - Easy to implement
  - Can be tricky to optimize parameters
- System simplifications: Decoupled and cascaded control

Questions ?
