## Multiple View Geometry: Solution Sheet 3

Prof. Dr. Daniel Cremers,

Shenhan Qian, Simon Weber, Anna Ribic, and Tarun Yenamandra

Computer Vision Group, TU Munich

Wednesdays 16:15-18:15 at Hörsaal 2, "Interims I" (5620.01.102), and on RBG Live

Exercise: May 21s, 2025

1. (a) 
$$M = \begin{pmatrix} I & T \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 & t_x \\ 0 & 1 & 0 & t_y \\ 0 & 0 & 1 & t_z \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

(b) 
$$M = \begin{pmatrix} R & 0 \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & 0 \\ r_{21} & r_{22} & r_{23} & 0 \\ r_{31} & r_{32} & r_{33} & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

(c) 
$$M = \begin{pmatrix} I & T \\ 0 & 1 \end{pmatrix} \begin{pmatrix} R & 0 \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} R & T \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & t_x \\ r_{21} & r_{22} & r_{23} & t_y \\ r_{31} & r_{32} & r_{33} & t_z \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

$$\text{(d)} \ \ M = \begin{pmatrix} R & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} I & T \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} R & RT \\ 0 & 1 \end{pmatrix} = \begin{pmatrix} r_{11} & r_{12} & r_{13} & r_{1}T \\ r_{21} & r_{22} & r_{23} & r_{2}T \\ r_{31} & r_{32} & r_{33} & r_{3}T \\ 0 & 0 & 0 & 1 \end{pmatrix},$$

where 
$$r_1, r_2, r_3$$
 are the row vectors of  $R$ :  $R = \begin{pmatrix} -r_1 - \\ -r_2 - \\ -r_3 - \end{pmatrix}$ .

2. Let 
$$M:=(M_1-M_2)=:\begin{pmatrix} m_{11} & m_{12} & m_{13} \\ m_{21} & m_{22} & m_{23} \\ m_{31} & m_{32} & m_{33} \end{pmatrix}$$
.

"⇒":

We show that M is skew-symmetric by distinguishing diagonal and off-diagonal elements of  $M^{\boldsymbol{\cdot}}$ 

(a) 
$$\forall i : 0 = e_i^{\top} M e_i = m_{ii}$$

where  $e_i = i$ -th unit vector

(b) 
$$\forall i \neq j : 0 = (e_i + e_j)^{\top} M(e_i + e_j)$$
  
=  $m_{ii} + m_{jj} + m_{ij} + m_{ji} \Rightarrow m_{ij} = -m_{ji}$ 

where  $e_j = j$ -th unit vector

hence,  $m_{ii} = 0$  and  $m_{ij} = -m_{ji}$ , i.e. M is skew-symmetric.

1

"⇐":

using  $M = -M^{\top}$ , we directly calculate

$$\forall x \colon x^{\top} M x = (x^{\top} M x)^{\top} = x^{\top} M^{\top} x = -(x^{\top} M x)$$
$$\Rightarrow x^{\top} M x = 0$$

$$\forall x \colon x^{\top} M x = x^{\top} (\check{M} \times x) = 0$$

Because M is skew-symmetric, Mx can be interpreted as a cross product. The result of any cross product with x is orthogonal to x.

3. We know:  $\omega = (\omega_1 \ \omega_2 \ \omega_3)^{\top}$  with  $||\omega|| = 1$  and  $\hat{\omega} = \begin{pmatrix} 0 & -\omega_3 & \omega_2 \\ \omega_3 & 0 & -\omega_1 \\ -\omega_2 & \omega_1 & 0 \end{pmatrix}$ 

(a)

$$\begin{split} \hat{\omega}^2 &= \begin{pmatrix} -(\omega_2^2 + \omega_3^2) & \omega_1 \omega_2 & \omega_1 \omega_3 \\ \omega_1 \omega_2 & -(\omega_1^2 + \omega_3^2) & \omega_2 \omega_3 \\ \omega_1 \omega_3 & \omega_2 \omega_3 & -(\omega_1^2 + \omega_2^2) \end{pmatrix} \\ &= \begin{pmatrix} \omega_1^2 - \underbrace{(\omega_1^2 + \omega_2^2 + \omega_3^2)}_{1} & \omega_1 \omega_2 & \omega_1 \omega_3 \\ \omega_1 \omega_2 & \omega_2^2 - \underbrace{(\omega_2^2 + \omega_1^2 + \omega_3^2)}_{1} & \omega_2 \omega_3 \\ \omega_1 \omega_3 & \omega_2 \omega_3 & \omega_3^2 - \underbrace{(\omega_3^2 + \omega_1^2 + \omega_2^2)}_{1} \end{pmatrix} \\ &= \begin{pmatrix} \omega_1^2 & \omega_1 \omega_2 & \omega_1 \omega_3 \\ \omega_1 \omega_2 & \omega_2^2 & \omega_2 \omega_3 \\ \omega_1 \omega_3 & \omega_2 \omega_3 & \omega_3^2 \end{pmatrix} - \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix} \\ &= \omega_1^{T} & \mathbf{I} & \mathbf{I} & \mathbf{I} & \mathbf{I} & \mathbf{I} & \mathbf{I} \\ &= \omega_1^{T} & \mathbf{I} & \mathbf$$

$$\begin{array}{lll} \hat{\omega}^3 & = & \hat{\omega} \, \hat{\omega}^2 \\ & = & \hat{\omega} \, (\omega \omega^\top - I) \\ & = & \hat{\omega} \, \omega \, (\omega^\top) - \hat{\omega} I \\ & = & (\omega \times \omega) \, \omega^\top - \hat{\omega} \\ & = & -\hat{\omega} & (\text{as } \omega \times \omega = 0) \end{array}$$

Alternative solution for  $\hat{\omega}^3$ :

$$\hat{\omega}^{3} = \begin{pmatrix} -(\omega_{2}^{2} + \omega_{3}^{2}) & \omega_{1}\omega_{2} & \omega_{1}\omega_{3} \\ \omega_{1}\omega_{2} & -(\omega_{1}^{2} + \omega_{2}^{2}) & \omega_{2}\omega_{3} \\ \omega_{1}\omega_{3} & \omega_{2}\omega_{3} & -(\omega_{1}^{2} + \omega_{2}^{2}) \end{pmatrix} \cdot \begin{pmatrix} 0 & -\omega_{3} & \omega_{2} \\ \omega_{3} & 0 & -\omega_{1} \\ -\omega_{2} & \omega_{1} & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 0 & \omega_{3} \cdot \underbrace{(\omega_{1}^{2} + \omega_{2}^{2} + \omega_{3}^{2})}_{1} & -\omega_{2} \cdot \underbrace{(\omega_{1}^{2} + \omega_{2}^{2} + \omega_{3}^{2})}_{1} \\ -\omega_{3} \cdot \underbrace{(\omega_{1}^{2} + \omega_{2}^{2} + \omega_{3}^{2})}_{1} & 0 & \omega_{1} \cdot \underbrace{(\omega_{1}^{2} + \omega_{2}^{2} + \omega_{3}^{2})}_{1} \\ \omega_{2} \cdot \underbrace{(\omega_{1}^{2} + \omega_{2}^{2} + \omega_{3}^{2})}_{1} & -\omega_{1} \cdot \underbrace{(\omega_{1}^{2} + \omega_{2}^{2} + \omega_{3}^{2})}_{1} & 0 \end{pmatrix}$$

(b) The formulas for n even and odd can be found by writing down the solutions for  $n=1,\ldots,6$ :

$$\begin{array}{lll} \hat{\omega} & & & \\ \hat{\omega}^2 & & & \\ \hat{\omega}^3 & = -\hat{\omega} & & \\ \hat{\omega}^4 & = -\hat{\omega}^2 & & \text{as: } \hat{\omega}^4 = \hat{\omega}^3 \hat{\omega} = -\hat{\omega} \hat{\omega} = -\hat{\omega}^2 \\ \hat{\omega}^5 & = \hat{\omega} & & \text{as: } \hat{\omega}^5 = \hat{\omega}^4 \hat{\omega} = -\hat{\omega}^2 \hat{\omega} = -\hat{\omega}^3 = -(-\hat{\omega}) = \hat{\omega} \\ \hat{\omega}^6 & = \hat{\omega}^2 & & \text{as: } \hat{\omega}^6 = \hat{\omega}^5 \hat{\omega} = \hat{\omega} \hat{\omega} = \hat{\omega}^2 \end{array}$$

For even numbers:

$$\hat{\omega}^4 = -\hat{\omega}^2 
\hat{\omega}^6 = \hat{\omega}^2$$

For odd numbers:

$$\hat{\omega}$$

$$\hat{\omega}^3 = -\hat{\omega}$$

$$\hat{\omega}^5 = \hat{\omega}$$

even: 
$$\hat{\omega}^{2n}=(-1)^{n+1}\,\hat{\omega}^2$$
 for  $n\geq 1$  odd:  $\hat{\omega}^{2n+1}=(-1)^n\,\hat{\omega}$  for  $n\geq 0$ 

Proof via complete induction:

- i. For even numbers 2n where  $n \ge 1$ :
  - n = 1:  $\hat{\omega}^2 = (-1)^2 \hat{\omega}^2$
  - Induction step  $n \to n+1$  :

$$\begin{array}{lll} \hat{\omega}^{2(n+1)} & = & \hat{\omega}^{2n} \cdot \hat{\omega}^2 \\ & = & (-1)^{n+1} \cdot \hat{\omega}^2 \cdot \hat{\omega}^2 \\ & = & (-1)^{n+1} \cdot \hat{\omega}^3 \cdot \hat{\omega} \\ & \stackrel{(a)}{=} & (-1)^{(n+1)+1} \cdot \hat{\omega}^2 \end{array} \tag{assumption}$$

ii. For odd numbers 2n+1 where  $n \geq 0$ :

$$n = 0$$
:  $\hat{\omega}^1 = (-1)^0 \hat{\omega}$ 

- Induction step  $n \rightarrow n+1$  :

$$\begin{array}{rcl} \hat{\omega}^{2(n+1)+1} & = & \hat{\omega}^{2n+1} \cdot \hat{\omega}^2 \\ & = & (-1)^n \cdot \hat{\omega} \cdot \hat{\omega}^2 \\ & = & (-1)^n \cdot \hat{\omega}^3 \\ & \stackrel{(a)}{=} & (-1)^{n+1} \cdot \hat{\omega} \end{array} \tag{assumption}$$

(c) We know:  $\omega \in \mathbb{R}^3$ . Let  $\nu = \frac{\omega}{\|\omega\|}$  and  $t = \|\omega\|$ . Hence,  $w = \nu t$ ,  $\hat{\omega} = \hat{\nu} t$ .

$$\begin{array}{lcl} e^{\hat{\omega}} & = & e^{\hat{\nu}t} \\ & = & \displaystyle\sum_{n=0}^{\infty} \frac{(\hat{\nu}t)^n}{n!} \\ & = & \displaystyleI + \displaystyle\sum_{n=1}^{\infty} \frac{t^{2n}}{(2n)!} \, \hat{\nu}^{2n} + \displaystyle\sum_{n=0}^{\infty} \frac{t^{2n+1}}{(2n+1)!} \, \hat{\nu}^{2n+1} \\ & \stackrel{(b)}{=} & \displaystyleI + \displaystyle\sum_{n=1}^{\infty} (-1)^{n+1} \frac{t^{2n}}{(2n)!} \, \hat{\nu}^2 + \displaystyle\sum_{n=0}^{\infty} (-1)^n \frac{t^{2n+1}}{(2n+1)!} \, \hat{\nu} \\ & \stackrel{(\operatorname{def.})}{=} & \displaystyleI + \frac{\hat{\omega}^2}{\|\omega\|^2} (1 - \cos(\|\omega\|)) + \frac{\hat{\omega}}{\|\omega\|} \sin(\|\omega\|) \end{array}$$
