### Unconstrained, differentiable, possibly nonconvex optimization

Problem setting:

$$\text{minimize } J(u) \quad \text{over } u \in \mathbb{E}.$$

Assume:

- ①  $J : \mathbb{E} \rightarrow \mathbb{R}$  is continuously differentiable.
- ② There exists a global minimizer  $u^*$ . (Typically, an optim algorithm seeks for a local minimizer s.t.  $\nabla J(u^*) = 0$ .)

# Descent method

## Descent method

Initialize  $u^0 \in \mathbb{E}$ . Iterate with  $k = 0, 1, 2, \dots$

- ① If the stopping criteria  $\|\nabla J(u^k)\| \leq \epsilon$  is *not* satisfied, then continue; otherwise return  $u^k$  and stop.
- ② Choose a **descent direction**  $d^k \in \mathbb{E}$  s.t.

$$\langle \nabla J(u^k), d^k \rangle < 0.$$

- ③ Choose an “appropriate” step size  $\tau^k > 0$ , and update

$$u^{k+1} = u^k + \tau^k d^k.$$

## Theorem

If  $\langle \nabla J(u^k), d^k \rangle < 0$ , then  $J(u^k + \tau d^k) < J(u^k)$  for all sufficiently small  $\tau > 0$ .

## Theorem

If  $\langle \nabla J(u^k), d^k \rangle < 0$ , then  $J(u^k + \tau d^k) < J(u^k)$  for all sufficiently small  $\tau > 0$ .

Proof: Use the Taylor expansion:

$$\begin{aligned} J(u^k + \tau d^k) &= J(u^k) + \tau \left\langle \nabla J(u^k), d^k \right\rangle + o(\tau) \\ &= J(u^k) + \tau \left( \left\langle \nabla J(u^k), d^k \right\rangle + o(1) \right) < J(u^k) \quad \text{as } \tau \rightarrow 0^+. \end{aligned}$$

Summary

## Choices of descent direction

- ① Scaled gradient:  $d^k = -(H^k)^{-1} \nabla J(u^k)$ .
- ② Gradient/Steepest descent:  $H^k = I$ .
- ③ Newton:  $H^k = \nabla^2 J(u^k)$ , assuming  $J$  is twice continuously differentiable and  $\nabla^2 J(u^k)$  is spd.
- ④ Quasi-Newton:  $H^k \approx \nabla^2 J(u^k)$ ,  $H^k$  is spd.

Summary

## Lemma (feasibility of line search)

Assume that  $J : \mathbb{E} \rightarrow \mathbb{R}$  is continuously differentiable,  $\langle \nabla J(u^k), d^k \rangle < 0 \forall k$ , and  $0 < c_1 < c_2 < 1$ . Then there exists an open interval in which the step size  $\tau$  satisfies (A) and (C).

Proof: on board.

# Convergence of backtracking line search

## Lemma (feasibility of line search)

Assume that  $J : \mathbb{E} \rightarrow \mathbb{R}$  is continuously differentiable,  $\langle \nabla J(u^k), d^k \rangle < 0 \forall k$ , and  $0 < c_1 < c_2 < 1$ . Then there exists an open interval in which the step size  $\tau$  satisfies (A) and (C).

Proof: on board.

## Theorem (Zoutendijk)

Assume that  $J : \mathbb{E} \rightarrow \mathbb{R}$  is cont'lly differentiable, and (A) and (C) are both satisfied with  $0 < c_1 < c_2 < 1$  for each  $k$ . In addition,  $J$  is  $\mu$ -Lipschitz differentiable on  $\{u \in \mathbb{E} : J(u) \leq J(u^0)\}$ . Then

$$\sum_{k=0}^{\infty} \frac{|\langle \nabla J(u^k), d^k \rangle|^2}{\|d^k\|^2} < \infty.$$

Proof: on board.

## Remark

If  $\frac{|\langle \nabla J(u^k), d^k \rangle|}{\|\nabla J(u^k)\| \|d^k\|} \geq \text{constant} > 0$ , then  $\lim_{k \rightarrow \infty} \|\nabla J(u^k)\| = 0$ .

Convergence Theory

Acceleration

Summary

# Majorize-minimize method

## Majorizing function

A function  $\hat{J}(\cdot; u)$  is a **majorant** of  $J$  at  $u \in \mathbb{E}$  if

$$\begin{cases} \hat{J}(u; u) = J(u), \\ \hat{J}(\cdot; u) \geq J(\cdot). \end{cases}$$

Gradient Methods

Proximal Algorithms

Convergence Theory

Acceleration

Summary

# Majorize-minimize method

## Majorizing function

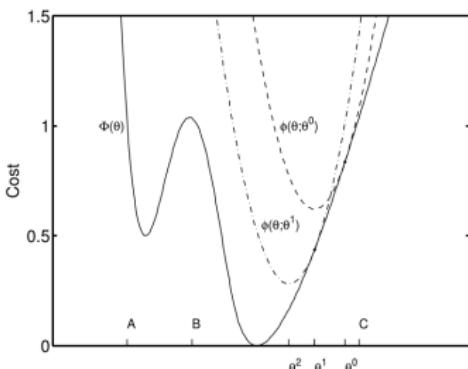

A function  $\hat{J}(\cdot; u)$  is a **majorant** of  $J$  at  $u \in \mathbb{E}$  if

$$\begin{cases} \hat{J}(u; u) = J(u), \\ \hat{J}(\cdot; u) \geq J(\cdot). \end{cases}$$

## Majorize-minimize (MM) algorithm

Let  $\hat{J}(\cdot; u)$  majorize  $J \quad \forall u \in \mathbb{E}$ . Then the MM iteration reads:

$$u^{k+1} \in \arg \min_u \hat{J}(u; u^k).$$

## Remark

- ① Monotonic decrease of objectives:

$$J(u^{k+1}) \leq \hat{J}(u^{k+1}; u^k) \leq \hat{J}(u^k; u^k) = J(u^k).$$

- ② Efficiency of MM relies on the choice of the majorant  $\hat{J}(\cdot; u)$ , i.e.,  $\hat{J}(\cdot; u)$  is easy to minimize.
- ③ Common choices of  $\hat{J}(\cdot; u)$  are quadratics.

Gradient Methods

Proximal Algorithms

Convergence Theory

Acceleration

Summary

# Gradient descent as MM

## Remark

- ① Monotonic decrease of objectives:

$$J(u^{k+1}) \leq \hat{J}(u^{k+1}; u^k) \leq \hat{J}(u^k; u^k) = J(u^k).$$

- ② Efficiency of MM relies on the choice of the majorant  $\hat{J}(\cdot; u)$ , i.e.,  $\hat{J}(\cdot; u)$  is easy to minimize.
- ③ Common choices of  $\hat{J}(\cdot; u)$  are quadratics.

## Gradient descent as MM

- Observe that  $u^{k+1} = u^k - \tau \nabla J(u^k)$  iff

$$u^{k+1} = \arg \min_u J(u^k) + \left\langle \nabla J(u^k), u - u^k \right\rangle + \frac{1}{2\tau} \|u - u^k\|^2.$$

- When  $J(u^k) + \langle \nabla J(u^k), \cdot - u^k \rangle + \frac{1}{2\tau} \|\cdot - u^k\|^2 \geq J(\cdot)$  holds?

# Gradient descent as MM

## Lemma

Assume that  $J : \mathbb{E} \rightarrow \mathbb{R}$  is  $\mu$ -Lipschitz differentiable. Then  
 $\forall u, v \in \mathbb{E}$  :

$$|J(v) - J(u) - \langle \nabla J(u), v - u \rangle| \leq \frac{\mu}{2} \|v - u\|^2.$$

Proof: on board.

Proximal Algorithms

Convergence Theory

Acceleration

Summary

# Gradient descent as MM

## Lemma

Assume that  $J : \mathbb{E} \rightarrow \mathbb{R}$  is  $\mu$ -Lipschitz differentiable. Then  $\forall u, v \in \mathbb{E}$ :

$$|J(v) - J(u) - \langle \nabla J(u), v - u \rangle| \leq \frac{\mu}{2} \|v - u\|^2.$$

Proof: on board.

## Theorem (convergence of gradient descent)

Assume that  $J : \mathbb{E} \rightarrow \mathbb{R}$  is  $\mu$ -Lipschitz differentiable. Then the gradient descent iteration

$$u^{k+1} = u^k - \tau \nabla J(u^k)$$

with  $\tau \in (0, 1/\mu]$  yields  $\lim_{k \rightarrow \infty} \nabla J(u^k) = 0$ .

Proof: on board.

## Gradient descent as MM

### Lemma

Assume that  $J : \mathbb{E} \rightarrow \mathbb{R}$  is  $\mu$ -Lipschitz differentiable. Then  $\forall u, v \in \mathbb{E}$ :

$$|J(v) - J(u) - \langle \nabla J(u), v - u \rangle| \leq \frac{\mu}{2} \|v - u\|^2.$$

Proof: on board.

### Theorem (convergence of gradient descent)

Assume that  $J : \mathbb{E} \rightarrow \mathbb{R}$  is  $\mu$ -Lipschitz differentiable. Then the gradient descent iteration

$$u^{k+1} = u^k - \tau \nabla J(u^k)$$

with  $\tau \in (0, 1/\mu]$  yields  $\lim_{k \rightarrow \infty} \nabla J(u^k) = 0$ .

Proof: on board.

### Recipe of convergence

By solving the surrogate problem in MM, we achieve: (1) sufficient decrease in the objective; (2) inexact optimality condition which matches the exact OC in the limit.

Summary

## Forward-backward splitting

- Consider the convex optimization problem:

$$\min_u F(u) + G(u),$$

with  $G$  differentiable and  $F$  possibly non-differentiable.

- Its minimizer is characterized by

$$0 \in \partial F(u) + \nabla G(u).$$

## Forward-backward splitting

- Consider the convex optimization problem:

$$\min_u F(u) + G(u),$$

with  $G$  differentiable and  $F$  possibly non-differentiable.

- Its minimizer is characterized by

$$0 \in \partial F(u) + \nabla G(u).$$

- Forward-backward splitting (FBS):**

$$\begin{aligned} u^{k+1} &= \text{prox}_{\tau F}(u^k - \tau \nabla G(u^k)) \\ &= (I + \tau \partial F)^{-1} \circ (I - \tau \nabla G)(u^k). \end{aligned}$$

- FBS as *semi-implicit Euler scheme*:

$$\frac{u^{k+1} - u^k}{\tau} \in -\partial F(u^{k+1}) - \nabla G(u^k).$$

## Example: Split feasibility problem

### Split feasibility problem

Given nonempty, closed, convex sets  $C_1 \subset \mathbb{E}_1$ ,  $C_2 \subset \mathbb{E}_2$ , and linear operator  $K : \mathbb{E}_1 \rightarrow \mathbb{E}_2$ , find  $u \in \mathbb{E}_1$  s.t.  $u \in C_1$ ,  $Ku \in C_2$ .

- Variational model:

$$\min_{u \in \mathbb{E}_1} \delta_{C_1}(u) + \frac{1}{2} \|Ku - \text{proj}_{C_2}(Ku)\|^2.$$

Note that  $\frac{1}{2} \|v - \text{proj}_{C_2}(v)\|^2 = \text{env}_1 \delta_{C_2}(v)$ .

Summary

## Primal-dual hybrid gradient

- By Fenchel-Rockafellar duality theorem, we reformulate

$$\min_u F(Ku) + G(u)$$

as the saddle-point problem:

$$\sup_p \inf_u \langle p, Ku \rangle + G(u) - F^*(p).$$

- **Primal-dual hybrid gradient (PDHG) ( $st > \|K\|^2$ ):**

$$u^{k+1} = \arg \min_u \left\langle u, K^\top p^k \right\rangle + G(u) + \frac{s}{2} \|u - u^k\|^2,$$

$$p^{k+1} = \arg \min_p - \left\langle K(2u^{k+1} - u^k), p \right\rangle + F^*(p) + \frac{t}{2} \|p - p^k\|^2.$$

- Optimality conditions for the updates:

$$0 \in \partial G(u^{k+1}) + K^\top p^k + s(u^{k+1} - u^k),$$

$$0 \in \partial F^*(p^{k+1}) - K(2u^{k+1} - u^k) + t(p^{k+1} - p^k).$$

## Scaled primal-dual hybrid gradient

Optimization  
Algorithms

- Recall PDGH:

$$0 \in \partial G(u^{k+1}) + K^\top p^k + s(u^{k+1} - u^k),$$

$$0 \in \partial F^*(p^{k+1}) - K(2u^{k+1} - u^k) + t(p^{k+1} - p^k).$$

- Replace  $s, t$  by spd matrices  $S, T \rightsquigarrow$  Scaled PDHG:

$$0 \in \partial G(u^{k+1}) + K^\top p^k + S(u^{k+1} - u^k),$$

$$0 \in \partial F^*(p^{k+1}) - K(2u^{k+1} - u^k) + T(p^{k+1} - p^k).$$

- Scaled PDHG in compact form:

$$0 \in \begin{bmatrix} S & -K^\top \\ -K & T \end{bmatrix} \left( \begin{bmatrix} u^{k+1} \\ p^{k+1} \end{bmatrix} - \begin{bmatrix} u^k \\ p^k \end{bmatrix} \right) + \begin{bmatrix} \partial G & K^\top \\ -K & \partial F^* \end{bmatrix} \begin{bmatrix} u^{k+1} \\ p^{k+1} \end{bmatrix}.$$

Summary

# Fixed-point iteration

## Fixed-point iteration

Proximal algorithm as *fixed-point iteration*:

$$u^{k+1} = \Phi(u^k).$$

Its convergence depends on the property of  $\Phi$ .

## Definition

Let  $C$  be a nonempty, closed, convex subset of  $\mathbb{E}$ , and  $\Phi : C \rightarrow \mathbb{E}$ . Then  $\Phi$  is:

- ①  $\mu$ -Lipschitz with modulus  $\mu \geq 0$  if

$$\forall u, v \in C : \|\Phi(u) - \Phi(v)\| \leq \mu \|u - v\|.$$

- ② **contractive** if  $\Phi$  is  $\mu$ -Lipschitz with modulus  $\mu \in [0, 1)$ .
- ③ **nonexpansive** if  $\Phi$  is 1-Lipschitz.

## Definition

Let  $C$  be a nonempty, closed, convex subset of  $\mathbb{E}$ , and  $\Phi : C \rightarrow \mathbb{E}$ . Then  $\Phi$  is:

- ①  $\mu$ -Lipschitz with modulus  $\mu \geq 0$  if

$$\forall u, v \in C : \|\Phi(u) - \Phi(v)\| \leq \mu \|u - v\|.$$

- ② **contractive** if  $\Phi$  is  $\mu$ -Lipschitz with modulus  $\mu \in [0, 1)$ .
- ③ **nonexpansive** if  $\Phi$  is 1-Lipschitz.

## Remark

- ① If  $\Phi$  is contractive (mod.  $\mu \in [0, 1)$ ), then by **Banach fixed point theorem** the iteration  $u^{k+1} = \Phi(u^k)$  converges to the unique fixed point  $u^*$  linearly:  $\|u^k - u^*\| \leq \mu^k \|u^0 - u^*\|$ .

Gradient Methods

Proximal Algorithms

Convergence Theory

Acceleration

Summary

## Definition

Let  $C$  be a nonempty, closed, convex subset of  $\mathbb{E}$ , and  $\Phi : C \rightarrow \mathbb{E}$ . Then  $\Phi$  is:

Summary

# Averaged operator

## Definition

Let  $C$  be a nonempty, closed, convex subset of  $\mathbb{E}$ , and  $\Phi : C \rightarrow \mathbb{E}$ . Then  $\Phi$  is  $\alpha$ -**averaged** with  $\alpha \in (0, 1)$  if there exists a nonexpansive operator  $\Psi : C \rightarrow \mathbb{E}$  such that

$$\Phi = (1 - \alpha)I + \alpha\Psi.$$

In particular, “ $\frac{1}{2}$ -averaged” is also called **firmly nonexpansive**.

Gradient Methods

Proximal Algorithms

Convergence Theory

Acceleration

Summary

# Averaged operator

## Definition

Let  $C$  be a nonempty, closed, convex subset of  $\mathbb{E}$ , and  $\Phi : C \rightarrow \mathbb{E}$ . Then  $\Phi$  is  **$\alpha$ -averaged** with  $\alpha \in (0, 1)$  if there exists a nonexpansive operator  $\Psi : C \rightarrow \mathbb{E}$  such that

$$\Phi = (1 - \alpha)I + \alpha\Psi.$$

In particular, “ $\frac{1}{2}$ -averaged” is also called **firmly nonexpansive**.

## Proposition

Let  $C$  be a nonempty, closed, convex subset of  $\mathbb{E}$ ,  $\Phi : C \rightarrow \mathbb{E}$ , and  $\alpha \in (0, 1)$ . Then the following statements are equivalent:

- ①  $\Phi$  is  $\alpha$ -averaged.
- ②  $(1 - \frac{1}{\alpha})I + \frac{1}{\alpha}\Phi$  is nonexpansive.
- ③  $\forall u, v \in C : \|\Phi(u) - \Phi(v)\|^2 \leq \|u - v\|^2 - \frac{1-\alpha}{\alpha} \|(I - \Phi)(u) - (I - \Phi)(v)\|^2$ .
- ④  $\forall u, v \in C : \|\Phi(u) - \Phi(v)\|^2 + (1 - 2\alpha)\|u - v\|^2 \leq 2(1 - \alpha) \langle u - v, \Phi(u) - \Phi(v) \rangle$ .

Proof: on board.

## Averaged operator in proximal algorithms

- Recall the customized proximal iteration:

$$u^{k+1} = \Phi^{(\text{cp})}(u^k), \quad \Phi^{(\text{cp})} = (M + R)^{-1}M,$$

for given spd matrix  $M$  and monotone operator  $R$ .

- One can verify that  $\Phi^{(\text{cp})}$  is firmly nonexpansive under the scaled norm  $\|\cdot\|_M = \sqrt{\langle \cdot, M \cdot \rangle}$ .

## Averaged operator in proximal algorithms

- Recall the customized proximal iteration:

$$u^{k+1} = \Phi^{(\text{cp})}(u^k), \quad \Phi^{(\text{cp})} = (M + R)^{-1}M,$$

for given spd matrix  $M$  and monotone operator  $R$ .

- One can verify that  $\Phi^{(\text{cp})}$  is firmly nonexpansive under the scaled norm  $\|\cdot\|_M = \sqrt{\langle \cdot, M \cdot \rangle}$ .
- Recall Douglas-Rachford splitting (in compact form):

$$v^{k+1} = \Phi^{(\text{drs})}(v^k), \quad \Phi^{(\text{drs})} = \frac{1}{2}I + \frac{1}{2}\text{refl}_{\tau F} \circ \text{refl}_{\tau G},$$

for some proper, convex, lsc functions  $F, G : \mathbb{E} \rightarrow \overline{\mathbb{R}}$ .

- Since  $\text{refl}_{\tau F} = 2\text{prox}_{\tau F} - I$  is nonexpansive and so is  $\text{refl}_{\tau G}$ ,  $\Phi^{(\text{drs})}$  is firmly nonexpansive.

## Averaged operator in proximal algorithms

- Recall the customized proximal iteration:

$$u^{k+1} = \Phi^{(\text{cp})}(u^k), \quad \Phi^{(\text{cp})} = (M + R)^{-1}M,$$

for given spd matrix  $M$  and monotone operator  $R$ .

- One can verify that  $\Phi^{(\text{cp})}$  is firmly nonexpansive under the scaled norm  $\|\cdot\|_M = \sqrt{\langle \cdot, M \cdot \rangle}$ .
- Recall Douglas-Rachford splitting (in compact form):

$$v^{k+1} = \Phi^{(\text{drs})}(v^k), \quad \Phi^{(\text{drs})} = \frac{1}{2}I + \frac{1}{2}\text{refl}_{\tau F} \circ \text{refl}_{\tau G},$$

for some proper, convex, lsc functions  $F, G : \mathbb{E} \rightarrow \overline{\mathbb{R}}$ .

- Since  $\text{refl}_{\tau F} = 2\text{prox}_{\tau F} - I$  is nonexpansive and so is  $\text{refl}_{\tau G}$ ,  $\Phi^{(\text{drs})}$  is firmly nonexpansive.
- Recall forward-backward splitting:

$$u^{k+1} = \Phi^{(\text{fbs})}(u^k), \quad \Phi^{(\text{fbs})} = \text{prox}_{\tau F} \circ (I - \tau \nabla G),$$

where  $G$  is  $\mu$ -Lipschitz differentiable and  $\tau \in (0, 2/\mu)$ .

- As a consequence of the Baillon-Haddad Theorem (next slide),  $I - \tau \nabla G$  is an averaged operator. Hence,  $\Phi^{(\text{fbs})}$  is a composition of two averaged operators (again averaged).

## Theorem (Krasnoselskii in Hilbert space)

Let  $C$  be a nonempty, closed, convex subset of a (real) Hilbert space  $\mathbb{H}$ , and  $u^{k+1} = \Phi(u^k)$  for  $k = 0, 1, 2, \dots$  where  $\Phi : C \rightarrow C$  satisfies:

- ①  $\Phi$  is  $\alpha$ -averaged for some  $\alpha \in (0, 1)$ .
- ②  $\Phi$  has at least one fixed point.

Then  $\{u^k\}$  converges *weakly* to a fixed point of  $\Phi$ .

Proof: ...  $\Rightarrow \|u^{k+1} - \bar{u}\|^2 \leq \|u^0 - \bar{u}\|^2 - \frac{1-\alpha}{\alpha} \sum_{l=0}^k \|(\mathbf{I} - \Phi)(u^l)\|^2$   
 $\Rightarrow$  (i)  $\|u^k - \bar{u}\| \searrow c \geq 0$ ; (ii)  $\sum_{k=0}^{\infty} \|(\mathbf{I} - \Phi)(u^k)\|^2 < \infty$ .

(i)  $\Rightarrow \{u^k\}$  converges weakly to  $u^* \in C$  along a subsequence;  
(ii) & “demiclosedness principle”  $\Rightarrow u^* - \Phi(u^*) = 0$ .  $\Rightarrow \dots$   $\square$

## Lemma (demiclosedness principle)

Let  $C$  be a nonempty, closed, convex subset of a (real) Hilbert space  $\mathbb{H}$ , and  $\Phi : C \rightarrow \mathbb{H}$  be nonexpansive. For any sequence  $\{u^k\} \subset C$  s.t.  $\{u^k\}$  weakly converges to  $u \in C$  and  $u^k - \Phi(u^k)$  strongly converges to  $v \in \mathbb{H}$ , we have  $u - \Phi(u) = v$ .

Gradient Methods

Proximal Algorithms

Convergence Theory

Acceleration

Summary

## ① Accelerating gradient step:

- Second-order methods (Newton).
- Multistep methods:
  - Heavy-ball method (Polyak).
  - Accelerated gradient method (Nesterov).
- Embedding into proximal algorithms.

## ② Preconditioning proximal algorithms:

- Preconditioned PDHG algorithm.
- Diagonal preconditioners (Pock/Chambolle).
- Application to problems on weighted graphs.

## Newton's method

- Consider minimizing  $J : \mathbb{E} \rightarrow \mathbb{R}$ .  $J$  is convex and twice continuously differentiable.
- Classical Newton method:

$$d^k = -[\nabla^2 J(u^k)]^{-1} \nabla J(u^k), \quad u^{k+1} = u^k + d^k.$$

- ..., which minimizes the local quadratic model:

$$d^k = \arg \min_d J(u^k) + \left\langle \nabla J(u^k), d \right\rangle + \frac{1}{2} \left\langle d, \nabla^2 J(u^k) d \right\rangle.$$

Gradient Methods

Proximal Algorithms

## Proximal Newton method

$$\min_{u \in \mathbb{E}} F(u) + G(u),$$

where  $F$  is convex (possibly non-differentiable),  $G$  is convex and twice continuously differentiable.

### Proximal Newton method

Initialize  $u^0 \in \mathbb{E}$ . Iterate with  $k = 0, 1, 2, \dots$

- ①  $d^k = \arg \min_d F(u^k + d) + \langle \nabla G(u^k), d \rangle + \frac{1}{2} \langle d, \nabla^2 G(u^k) d \rangle.$
- ②  $u^{k+1} = u^k + d^k.$

### Theorem (local quadratic convergence of proximal Newton)

The proximal Newton method converges locally quadratically to the (global) minimizer  $u^*$  if  $\nabla^2 G(u^*)$  is spd.

Proof: on board.

### Remark

- ① Ensure global convergence via backtracking line search.
- ② Computation of  $d^k$  can be involved even if  $\text{prox}_F$  is easy.

## Heavy-ball (momentum) method

Minimize  $J$  that is convex and twice continuously differentiable.

### Heavy-ball method

Initialize  $u^0 \in \mathbb{E}$ , and set  $u^{-1} = u^0$ . Iterate with  $k = 0, 1, 2, \dots$

$$u^{k+1} = u^k - \tau \nabla J(u^k) + \theta(u^k - u^{k-1}),$$

where  $\tau, \theta > 0$  are step sizes (specified in the next slide).

Gradient Methods

Proximal Algorithms

Convergence Theory

Acceleration

Summary

# Heavy-ball (momentum) method

Minimize  $J$  that is convex and twice continuously differentiable.

## Heavy-ball method

Initialize  $u^0 \in \mathbb{E}$ , and set  $u^{-1} = u^0$ . Iterate with  $k = 0, 1, 2, \dots$

$$u^{k+1} = u^k - \tau \nabla J(u^k) + \theta(u^k - u^{k-1}),$$

where  $\tau, \theta > 0$  are step sizes (specified in the next slide).

- Originated from [Polyak, 1964].
- The term  $u^k - u^{k-1}$  is referred to as *momentum*.
- Related to the second-order ODE:

$$\theta \ddot{u} + (1 - \theta) \dot{u} + \tau \nabla J(u) = 0.$$

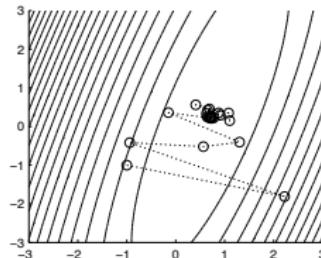

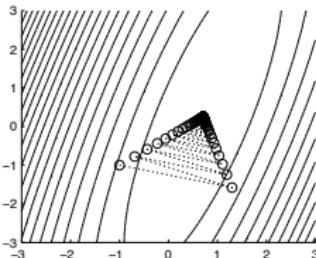

Figure: gradient descent (left) vs. heavy ball (right).

- Quantitative analysis of heavy-ball method:

$$u^{k+1} = u^k - \tau \nabla J(u^k) + \theta(u^k - u^{k-1}).$$

$$\begin{aligned} \begin{bmatrix} u^{k+1} - u^* \\ u^k - u^* \end{bmatrix} &= \begin{bmatrix} u^k + \theta(u^k - u^{k-1}) - u^* - \tau(\nabla J(u^k) - \nabla J(u^*)) \\ u^k - u^* \end{bmatrix} \\ &= \begin{bmatrix} u^k + \theta(u^k - u^{k-1}) - u^* - \tau \nabla^2 J(\tilde{u}^k)(u^k - u^*) \\ u^k - u^* \end{bmatrix} \quad (\tilde{u}^k \in [u^k, u^*]) \\ &= \begin{bmatrix} (1 + \theta)I - \tau \nabla^2 J(\tilde{u}^k) & -\theta I \\ I & 0 \end{bmatrix} \begin{bmatrix} u^k - u^* \\ u^{k-1} - u^* \end{bmatrix} =: A^k \begin{bmatrix} u^k - u^* \\ u^{k-1} - u^* \end{bmatrix}. \end{aligned}$$

## Preconditioning PDHG

- Recall the saddle-point problem:

$$\max_p \min_u \langle p, Ku \rangle + G(u) - F^*(p).$$

- Recall the scaled PDHG:

$$0 \in \partial G(u^{k+1}) + K^\top p^k + \textcolor{red}{S}(u^{k+1} - u^k), \quad \{\text{primal update}\}$$

$$0 \in \partial F^*(p^{k+1}) - K(2u^{k+1} - u^k) + \textcolor{blue}{T}(p^{k+1} - p^k). \quad \{\text{dual update}\}$$

- Compact-form PDHG:

$$0 \in \begin{bmatrix} \textcolor{red}{S} & -K^\top \\ -K & \textcolor{blue}{T} \end{bmatrix} \left( \begin{bmatrix} u^{k+1} \\ p^{k+1} \end{bmatrix} - \begin{bmatrix} u^k \\ p^k \end{bmatrix} \right) + \begin{bmatrix} \partial G & K^\top \\ -K & \partial F^* \end{bmatrix} \begin{bmatrix} u^{k+1} \\ p^{k+1} \end{bmatrix}.$$

- Here  $\textcolor{red}{S}$  is primal preconditioner,  $\textcolor{blue}{T}$  is dual preconditioner:

$$\left\{ \begin{array}{l} \hat{u} = \textcolor{red}{S}^{1/2}u, \hat{p} = \textcolor{blue}{T}^{1/2}p, \hat{K} = \textcolor{blue}{T}^{-1/2}KS^{-1/2}, \\ \hat{G} = G \circ \textcolor{red}{S}^{-1/2}, \hat{F} = F \circ \textcolor{blue}{T}^{1/2}. \\ \text{Solve: } \max_{\hat{p}} \min_{\hat{u}} \langle \hat{p}, \hat{K}\hat{u} \rangle + \hat{G}(\hat{u}) - \hat{F}^*(\hat{p}). \end{array} \right.$$

Acceleration  
Summary

- Here  $\mathbf{S}$  is primal preconditioner,  $\mathbf{T}$  is dual preconditioner:

$$\begin{cases} \hat{u} = \mathbf{S}^{1/2}u, \hat{p} = \mathbf{T}^{1/2}p, \hat{K} = \mathbf{T}^{-1/2}K\mathbf{S}^{-1/2}, \\ \hat{G} = G \circ \mathbf{S}^{-1/2}, \hat{F} = F \circ \mathbf{T}^{1/2}. \\ \text{Solve: } \max_{\hat{p}} \min_{\hat{u}} \langle \hat{p}, \hat{K}\hat{u} \rangle + \hat{G}(\hat{u}) - \hat{F}^*(\hat{p}). \end{cases}$$

- PDHG on  $(\hat{u}, \hat{p})$ :

$$\begin{aligned} 0 &\in \partial \hat{G}(\hat{u}^{k+1}) + \hat{K}^\top \hat{p}^k + (\hat{u}^{k+1} - \hat{u}^k), \\ 0 &\in \partial \hat{F}^*(\hat{p}^{k+1}) - \hat{K}(2\hat{u}^{k+1} - \hat{u}^k) + (\hat{p}^{k+1} - \hat{p}^k). \end{aligned}$$

- Compact-form PDHG on  $(\hat{u}, \hat{p})$ :

$$0 \in \begin{bmatrix} I & -\hat{K}^\top \\ -\hat{K} & I \end{bmatrix} \left( \begin{bmatrix} \hat{u}^{k+1} \\ \hat{p}^{k+1} \end{bmatrix} - \begin{bmatrix} \hat{u}^k \\ \hat{p}^k \end{bmatrix} \right) + \begin{bmatrix} \partial \hat{G} & \hat{K}^\top \\ -\hat{K} & \partial \hat{F}^* \end{bmatrix} \begin{bmatrix} \hat{u}^{k+1} \\ \hat{p}^{k+1} \end{bmatrix}.$$

## Preconditioning PDHG

- Here  $S$  is primal preconditioner,  $T$  is dual preconditioner:

$$\begin{cases} \hat{u} = S^{1/2}u, \hat{p} = T^{1/2}p, \hat{K} = T^{-1/2}KS^{-1/2}, \\ \hat{G} = G \circ S^{-1/2}, \hat{F} = F \circ T^{1/2}. \\ \text{Solve: } \max_{\hat{p}} \min_{\hat{u}} \langle \hat{p}, \hat{K}\hat{u} \rangle + \hat{G}(\hat{u}) - \hat{F}^*(\hat{p}). \end{cases}$$

- Compact-form PDHG on  $(\hat{u}, \hat{p})$ :

$$0 \in \begin{bmatrix} I & -\hat{K}^\top \\ -\hat{K} & I \end{bmatrix} \left( \begin{bmatrix} \hat{u}^{k+1} \\ \hat{p}^{k+1} \end{bmatrix} - \begin{bmatrix} \hat{u}^k \\ \hat{p}^k \end{bmatrix} \right) + \begin{bmatrix} \partial \hat{G} & \hat{K}^\top \\ -\hat{K} & \partial \hat{F}^* \end{bmatrix} \begin{bmatrix} \hat{u}^{k+1} \\ \hat{p}^{k+1} \end{bmatrix}.$$

### Proposition

Assume  $S, T$  are spd matrices. Then

$$\begin{aligned} M_{S,T} = \begin{bmatrix} S & -K^\top \\ -K & T \end{bmatrix} \succ 0 &\Leftrightarrow \begin{bmatrix} I & -\hat{K}^\top \\ -\hat{K} & I \end{bmatrix} \succ 0 \\ &\Leftrightarrow \|T^{-1/2}KS^{-1/2}\| < 1. \end{aligned}$$

Proof: Argue with *Schur complement*.

Gradient Methods

Proximal Algorithms

Convergence Theory

Acceleration

Summary

- Scaled PDHG:

$$\begin{cases} 0 \in \partial G(u^{k+1}) + K^\top p^k + S(u^{k+1} - u^k), \\ 0 \in \partial F^*(p^{k+1}) - K(2u^{k+1} - u^k) + T(p^{k+1} - p^k). \end{cases}$$

- Expectations on  $S$  and  $T$ :

- ➊  $S$  and  $T$  shall fulfill  $M_{S,T} \succ 0$ .
  - ➋ (Scaled) resolvents  $(S + \partial G)^{-1}$  and  $(T + \partial F^*)^{-1}$  are easy to compute.
  - ➌  $\hat{K} = T^{-1/2} K S^{-1/2}$  has smaller condition number than  $K$ .
    - The theory for why this accelerates convergence is open.
    - Empirical evidences of acceleration are observed.
- Goal: Design  $S$  and  $T$  that balance (1), (2), (3).

Summary

## Diagonal preconditioner

- Diagonal preconditioners [Pock/Chambolle, 2011]:

$$S = \text{diag}(\{s_j\}), \quad s_j = \sum_i |K_{ij}|^{2-\theta},$$

$$T = \text{diag}(\{t_i\}), \quad t_i = \sum_j |K_{ij}|^\theta,$$

where  $\theta \in [0, 2]$ .

- $\widehat{K} = T^{-1/2} K S^{-1/2}$  suggests that  $S$  (resp.  $T$ ) normalizes columns (resp. rows) of  $K$  by row (resp. column) sums.

# Convex optimization on weighted graphs

Optimization  
Algorithms

Tao Wu  
Yuesong Shen  
Zhenzhang Ye

- Let  $\mathcal{G} = (\mathcal{V}, \mathcal{E}, \omega)$  be a weighted graph, with  $\mathcal{V}$  set of vertices,  $\mathcal{E}$  set of edges,  $\omega : \mathcal{E} \rightarrow \mathbb{R}_+$  weight for edges.
- $\nabla \in \mathbb{R}^{|\mathcal{E}| \times |\mathcal{V}|}$  is the *incidence matrix* s.t. for each  $(j, j') \in \mathcal{E}$ :  
 $\nabla_{(j,j'),j} = 1$ ,  $\nabla_{(j,j'),j'} = -1$ ,  $\nabla_{(j,j'),j''} = 0$  whenever  $j'' \notin \{j, j'\}$ .
- Convex optimization on weighted graphs:

$$\min_{u: \mathcal{V} \rightarrow \mathbb{R}} F(Ku) + G(u).$$

where  $F : \mathbb{R}^{\mathcal{E}} \rightarrow \mathbb{R}$ ,  $G : \mathbb{R}^{\mathcal{V}} \rightarrow \mathbb{R}$  are convex functions, and  $K = \text{diag}(\omega)\nabla$ .

Gradient Methods

Proximal Algorithms

Convergence Theory

Acceleration

Summary

- Segment images represented on the 2D grid:

$$\min_{u: \mathcal{V} \rightarrow \mathbb{R}^L} \underbrace{\sum_{j \in \mathcal{V}} \left( \delta\{u_j \in \Delta^{L-1}\} + \langle u_j, f_j \rangle \right)}_{G(u)} + \alpha \underbrace{\sum_{l=1}^L \sum_{(j,j') \in \mathcal{E}} \omega_{j,j'} |u_j^l - u_{j'}^l|}_{F(Ku)},$$

- $\mathcal{V}$  contains image pixels;  $\mathcal{E}, \omega$  are model-dependent.
- Pointwise constraint:  $\Delta^{L-1}$  is the probability simplex in  $\mathbb{R}^L$ .
- Unary term:  $f: \mathcal{V} \rightarrow \mathbb{R}^L$  is the pixelwise prediction.
- Pairwise term:  $\omega_{j,j'}$  models pairwise similarities, e.g.
  - Edges are forged among spatially neighbored pixels; or
  - Use Gaussian similarity measure:  $\omega_{j,j'} = \exp\left(-\frac{|j-j'|^2}{\sigma^2}\right)$ .

Summary

## Empirical study

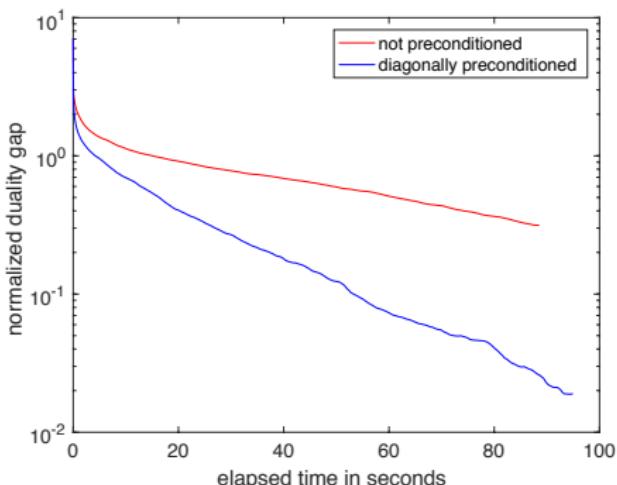

On the image segmentation example, we compare PDHG

$$\begin{cases} 0 \in \partial G(u^{k+1}) + K^\top p^k + S(u^{k+1} - u^k), \\ 0 \in \partial F^*(p^{k+1}) - K(2u^{k+1} - u^k) + T(p^{k+1} - p^k), \end{cases}$$

(i) without preconditioning and (ii) with preconditioning:

(i)  $S = sI$ ,  $T = tl$ ,  $s = t = \|K\|$ .

(ii)  $S = \text{diag}(\{s_j\})$ ,  $T = \text{diag}(\{t_i\})$ ,  $s_j = \sum_i |K_{ij}|$ ,  $t_i = \sum_j |K_{ij}|$ .
